

The Infinite Bandwidth Company™

General Description

The MIC2545A and MIC2549A are integrated high-side power switches optimized for low loss dc power switching and other power management applications, including Advanced Configuration and Power Interface (ACPI). The MIC2545A/ 49A is a cost-effective, highly integrated solution that requires few external components to satisfy USB and ACPI requirements.

Load current management features include a precision resistor-programmable output current-limit and a soft-start circuit, which minimizes inrush current when the switch is enabled. Thermal shutdown, along with adjustable current-limit, protects the switch and the attached device.

The MIC2545A/49A's open-drain flag output is used to indicate current-limiting or thermal shutdown to a local controller. The MIC2549A has an additional internal latch which turns the output off upon thermal shutdown, providing robust fault control. The enable signal is compatible with both 3V and 5V logic, and is also used as the thermal shutdown latch reset for the MIC2549A.

The MIC2545A and MIC2549A are available in active-high and active-low enable versions in 8-pin DIP, SOIC, and TSSOP packages.

MIC2545A/2549A

Programmable Current Limit High-Side Switch

Final Information

Features

- 2.7V to 5.5V input
- Adjustable current-limit up to 3A
- Reverse current flow blocking
- 90µA typical on-state supply current
- 1µA typical off-state supply current
- $50m\Omega$ maximum on-resistance
- Open-drain fault flag
- Thermal shutdown
- Thermal shutdown output latch (MIC2549A)
- 2ms (slow) soft-start turn-on, fast turnoff
- Available with active-high or active-low enable

Applications

- USB power distribution
- PCI Bus Power Switching
- Notebook PC
- ACPI power distribution
- PC card hot swap applications
- Inrush current-limiting

Typical Application

Typical Advanced Configuration and Power Interface (ACPI) Application

Pin Description

Pin Number SOP, DIP	Pin Number TSSOP	Pin Name	Pin Function	
1	1	EN	Enable (Input): Logic-compatible enable input (-1 version is active high, -2 version is active low). High input >1.8V typical; low input <1.4V typical. Do not float. MIC2549A only: Also resets thermal shutdown latch.	
2	3	FLG	Fault Flag (Output): Active-low, open-drain output. Indicates overcurrent or thermal shutdown. MIC2549A only: latched low on thermal shutdown.	
3	5	GND	Ground: Supply return.	
4	7	ILIM	Current Limit: Sets current limit threshold using an external resistor (R_{SET}) connected to ground. 76.8 Ω < R_{SET} < 459 Ω .	
5, 7	8, 12	IN	Supply Input: Output MOSFET drain. Also powers internal circuitry. Both IN pins must be externally connected together.	
6, 8	10, 14	OUT	Switch Output: Output MOSFET source. Both OUT pins must be externally connected together.	
	2,4,6,9,11,13	NC	not internally connected	

Absolute Maximum Ratings (Note 1)

Supply Voltage (V _{IN})	+7.0V
Output Voltage (V _{OUT})	+7.0V
Output Current (I _{OUT})	Internally Limited
Enable Input (V _{EN})	–0.3V to +7V
Fault Flag Voltage (V _{FLG})	+7.0V
Fault Flag Current (I _{FLG})	50mA
Storage Temperature (T _S)	–65°C to +150°C
Junction Temperature (T _J)	Internally Limited
Lead Temperature (soldering 5 sec.)	260°C
ESD Rating Note 3	2001\/

Operating Ratings (Note 2)

Supply Voltage (VIN)	+2.7V to +5.5V
Ambient Temperature Range (T _A)	–40°C to +85°C

Note 1. Exceeding the absolute maximum rating may damage the device.

Note 2. The device is not guaranteed to function outside its operating rating.

Note 3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.

Note 4. Off is \leq 0.8V and on is \geq 2.4V for the MIC2545A-1 and MIC2549A-1. Off is \geq 2.4V and on is \leq 0.8V for the MIC2545A-2 and MIC2549A-2. The enable input has about 100mV of hysteresis.

Note 5. Current limit is determined by: $I_{\text{LIMIT}} = \frac{230}{R_{\text{SET}}}$, where R_{SET} is in ohms, and 230 is typical current limit factor in volts.

Note 6. Assumes 4 layer PCB is used.

Note 7. Guaranteed by design but not production tested.

Typical Characteristics

Block Diagram

Functional Description

The MIC2545A and MIC2549A are high-side N-channel switches available with active-high or active-low enable inputs. Fault conditions turn off or inhibit turn-on of the output transistor and activate the open-drain error flag transistor making it sink current to ground.

Input and Output

IN is the power supply connection to the logic circuitry and the drain of the output MOSFET. OUT is the source of the output MOSFET. In a typical circuit, current flows from IN to OUT toward the load. If V_{OUT} is greater than V_{IN} , current will flow from OUT to IN since the switch is bidirectional when enabled. The output MOSFET and driver circuitry are also designed to allow the MOSFET source to be externally forced to a higher voltage than the drain ($V_{OUT} > V_{IN}$) when the switch is disabled. In this situation, the MIC2545A/49A avoids undesirable current flow from OUT to IN. Both IN pins must be connected together, and both OUT pins must be connected together.

Thermal Shutdown

Thermal shutdown shuts off the output MOSFET and signals the fault flag if the die temperature exceeds 135°C. 10°C of hysteresis prevents the switch from turning on until the die temperature drops to 125°C. Overtemperature detection functions only when the switch is enabled.

The MIC2549A features an internal latch which causes the part to remain off after thermal shutdown until a reset pulse is provided via the enable pin (pin 1). While in current-limit, the thermal shutdown latch prevents on/off cycling of the output. Refer to Figure 2 for timing diagram. The flag remains low until reset.

Enable Input

EN must be driven logic high or logic low, or be pulled high or low for a clearly defined input. Floating the input may cause unpredictable operation. EN should not be allowed to go negative with respect to GND.

Current-Limit Operation

The current limit is user adjustable with an external set resistor. Current limiting in the range of 500mA to 3A is available with a set point accuracy of better than $\pm 30\%$ ($\pm 20\%$ for I_{SET} 1 to 2.5A). The current-limit circuit prevents damage to the output MOSFET and external load.

The current-limit response of the MIC2545A/49A is based on the type of load that is applied to the output and is defined in three parts:

- 1. The first mode of operation is where the device enters a constant-current mode preventing further increases in output current. The value of this current, I_{LIMIT}, is defined by the value of R_{SET} as explained further in this section.
- When a short circuit is applied to the output of an enabled device the output current immediately folds back to a value less than I_{LIMIT} called I_{SHORT}. This further protects the load and reduces device power dissipation. Refer to the "Typical Characteristics: Output Current vs. Output Voltage" graph for details.
- 3. When a load is increased, the output current will proportionally increase up to the current-limit threshold, I_{TH} , as shown in the "Functional Characteristics: Current-Limit Response" graph. The device in this case will supply current slightly higher than the current-limit set point defined by R_{SET} . As the load is increased further the current folds back to I_{LIMIT} .

The nominal current-limit value, I_{LIMIT} , is set with an external resistor between ILIM (pin 4) and GND (pin 3). For a desired current-limit, the value of the external set resistor is given by:

$$\mathsf{R}_{\mathsf{SET}} = \left(\frac{230}{\mathsf{I}_{\mathsf{LIMIT}}}\right)$$

where:

$$76.8\Omega < R_{SFT} < 459\Omega$$

For example, to set a 1A nominal current-limit, ${\rm R}_{\rm SET}$ is calculated as:

$$\left(\frac{230}{1A}\right) = 230\Omega$$

Refer to the "Typical Characteristics: Current-Limit vs $\mathsf{R}_{\mathsf{SET}}$ " graph for more details.

Current through R_{SET} increases with output current. The voltage across R_{SET} could be monitored with a high impedance comparator to provide an indication of output current. R_{SET} should be between 76.8 Ω and 459 Ω (1% resister value).

Fault Flag

FLG is an N-channel, open-drain MOSFET output. The fault-flag is active (low) for current-limit or thermal shutdown conditions. The flag output MOSFET is capable of sinking a 10mA load to typically 100mV above ground. For applications with $V_{IN} \leq 3.6V$, it is recommended that flag current be limited to 5mA or less.

Applications Information

Supply Filtering

A 0.1μ F to 1μ F bypass capacitor from IN to GND, located near the MIC2545A and MIC2549A, is strongly recommended to control supply transients. Without a bypass capacitor, an output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

Input transients must not exceed the absolute maximum supply voltage ($V_{IN max} = 6V$) even for a short duration.

Figure 3. Supply Bypassing

Power Dissipation

The device's junction temperature depends on several factors such as the load, PCB layout, ambient temperature and package type. Equations that can be used to calculate power dissipation and junction temperature are found below.

Calculation of power dissipation can be accomplished by the following equation:

$$\mathsf{P}_{\mathsf{D}} = \mathsf{R}_{\mathsf{DS}(\mathsf{on})} \times (\mathsf{I}_{\mathsf{OUT}})2$$

To relate this to junction temperature, the following equation can be used:

$$\mathsf{T}_\mathsf{J} = \mathsf{P}_\mathsf{D} \times \theta_\mathsf{JA} + \mathsf{T}_\mathsf{A}$$

where:

 T_{I} = junction temperature

 T_A = ambient temperature

 θ_{JA} = is the thermal resistance of the package

Transient Overcurrent Filter

The inrush current from the connection of a heavy capacitive load may cause the fault flag to fall for $10\mu s$ to $200\mu s$ while the switch is in a constant-current mode, charging the capacitance.

Adding an optional series resistor-capacitor (R_{SET2}) in parallel with R_{SET}, as shown in Figure 4, allows the transient current-limit to be set to a different value than steady state. A typical USB hot-plug inrush is 2A to 3A for 10µs to 20µs. If R_{SET} is 435Ω (530mA), an R_{SET2} of 88Ω (2.5A) and C_{SET} of 1µF (RC ≈ 90µs) allows transient surge of 3A to pass for 90µs without tripping the overcurrent flag (FLG).

USB Power Distribution

The MIC2545A is ideal for meeting USB power distribution requirements. Figure 7 depicts a USB Host application. R_{SET} should be set to a value providing a current-limit >500mA. The accurate current-limit of the MIC2545A will reduce power supply current requirements. Also, fast reaction to short circuit faults prevent voltage droop in mobile PC applications.

Printed Circuit Board Hot-Plug

The MIC2545A/49A is an ideal inrush current-limiter suitable for hot-plug applications. Due to the integrated charge pump, the MIC2545A/49A presents a high impedance when off and slowly becomes a low impedance as it turns on. This "softstart" feature effectively isolates power supplies from highly capacitive loads by reducing inrush current during hot-plug events. Figure 5 shows how the MIC2545A may be used in a hot-plug application.

Figure 4. USB Host Application
