

**FEATURES**

- Selects between 1 of 8 inputs, and provides two precision, low skew CML output copies
- Guaranteed AC performance over temperature and voltage:
  - DC to 5Gbps throughput
  - <450ps propagation delay IN-to-Q ( $V_{IN} \geq 300mV$ )
  - <70ps  $t_r / t_f$  time
  - <15ps skew (output-to-output)
- Unique, patent-pending, channel-to-channel isolation design provides superior crosstalk performance
- Ultra-low jitter design:
  - <1ps<sub>rms</sub> random jitter
  - <10ps<sub>pp</sub> deterministic jitter
  - <10ps<sub>pp</sub> total jitter (clock)
  - <0.7ps<sub>rms</sub> crosstalk-induced jitter
- Unique, patent-pending, input termination and VT pin accepts DC- and AC-coupled inputs (CML, PECL, LVDS)
- 400mV CML output swing
- 50Ω source terminated outputs minimize round-trip reflections
- Power supply 2.5V ±5% or 3.3V ±10%
- -40°C to +85°C temperature range
- Available in 44-pin (7mm × 7mm) MLF™ package

Precision Edge™

**DESCRIPTION**

The SY58037U is a low jitter, low skew, high-speed 8:1 multiplexer with a 1:2 differential fanout buffer optimized for precision telecom and enterprise server distribution applications. The SY58037U distributes clock frequencies from DC to 4GHz and data rates to 5Gpbs guaranteed over temperature and voltage.

The SY58037U differential input includes Micrel's unique, 3-pin input termination architecture that directly interfaces to any differential signal (AC- or DC-coupled) as small as 100mV (200mVpp) without any level shifting or termination resistor networks in the signal path. The outputs are 50Ω source-terminated CML with extremely fast rise/fall time guaranteed to be less than 70ps.

The SY58037U features a patent-pending isolation design that significantly improves channel-to-channel crosstalk performance.

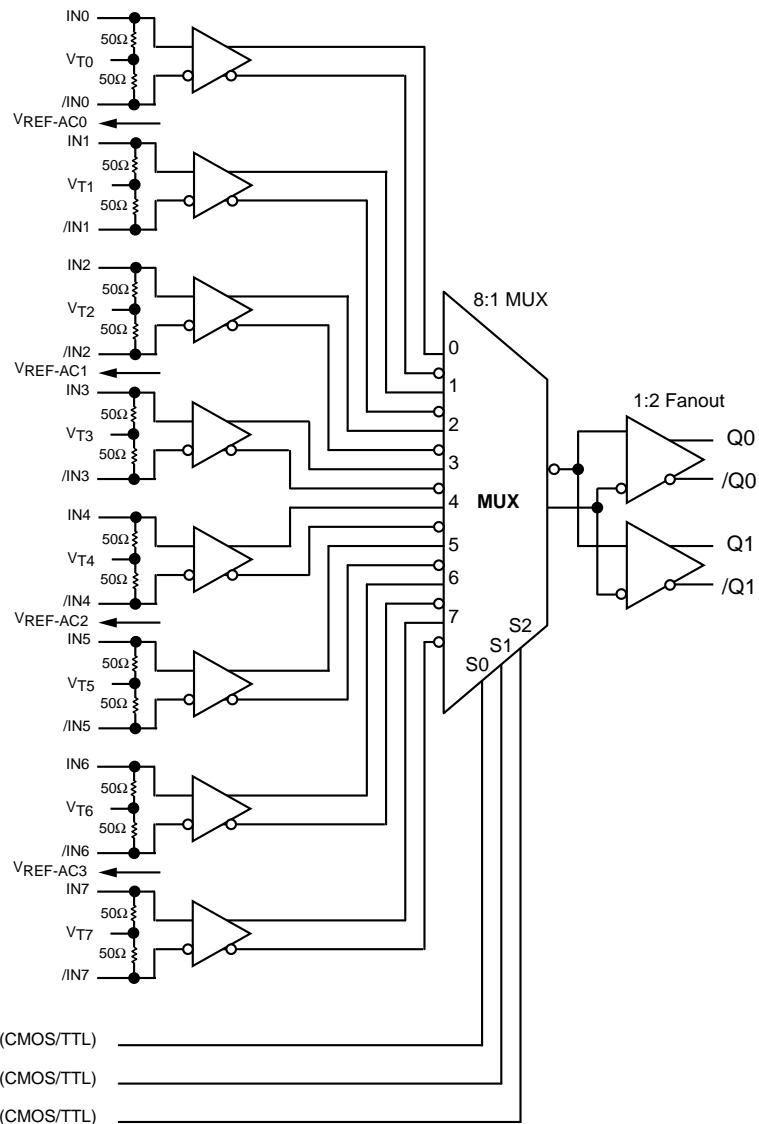

The SY58037U operates from a 2.5V ±5% or 3.3V ±10% supply and is guaranteed over the full industrial temperature range of -40°C to +85°C. The SY58037U is part of Micrel's high-speed, Precision Edge™ product line.

Data sheets and support documentation can be found on Micrel's web site at [www.micrel.com](http://www.micrel.com).

**APPLICATIONS**

- Data communication systems
- All SONET/SDH data/clock applications
- All Fibre Channel applications
- All Gigabit Ethernet applications

## PIN DESCRIPTION

Pin Number	Pin Name	Pin Function
20, 18, 16, 14, 13, 11, 9, 7, 5, 3, 1, 43, 42, 40, 38, 36	IN0, /IN0, IN1, /IN1, IN2, /IN2, IN3, /IN3, IN4, /IN4, IN5, /IN5, IN6, /IN6, IN7, /IN7	Differential Inputs: These input pairs are the differential signal inputs to the device. Inputs accept AC or DC-coupled signals as small as 100mV. Each pin of a pair internally terminates to a VT pin through $50\Omega$ . Note that these inputs will default to an indeterminate state if left open. Please refer to the "Input Interface Applications" section for more details.
19, 15, 12, 8, 4, 44, 41, 37	VT0, VT1 VT2, VT3, VT4, VT5, VT6, VT7	Input Termination Center-Tap: Each side of the differential input pair terminates to a VT pin. The VT pins provide a center-tap to a termination network for maximum interface flexibility. See "Input Interface Applications" section for more details.
17, 10, 2 39	VREF-AC0, VREF-AC1, VREF-AC2, VREF-AC3	Reference Voltage: This output biases to $V_{CC} - 1.2\text{V}$ . It is used when AC coupling the inputs (IN, /IN). For AC-coupled applications, connect VREF_AC to the VT pin and bypass with a $0.01\mu\text{F}$ low ESR capacitor to $V_{CC}$ . See "Input Interface Applications" section for more details.
21, 22, 35	SEL0, SEL1, SEL2	The TTL/CMOS-compatible inputs select the inputs to the multiplexer. Note that this input is internally connected to a $25\text{k}\Omega$ pull-up resistor and will default to a logic HIGH state if left open.
24, 27, 29, 32	VCC	Positive Power Supply. Bypass with $0.1\mu\text{F} \parallel 0.01\mu\text{F}$ low ESR capacitors as close to each VCC pin.
25, 26, 30, 31	Q0,/Q0, Q1,/Q1	Differential Outputs: These CML output pairs are the outputs of the device. Please refer to the truth table below for details. Unused output pairs may be left open. Each output is designed to drive 400mV into $100\Omega$ across each output pair.
23, 28, 33	GND, Exposed Pad	Ground. GND and exposed pad must both be connected to the most negative potential of chip ground.

**Notes:**

1. Permanent device damage may occur if ratings in the "Absolute Maximum Ratings" section are exceeded. This is a stress rating only and functional operation is not implied for conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Due to the limited drive capability, use for input of the same package only.
4. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.  $\Psi_{JB}$  uses 4-layer  $\theta_{JA}$  in still-air number unless otherwise stated.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6.  $V_{IH}$  (min), not lower than 1.2V.

**Notes:**

8. High-frequency AC-parameters are guaranteed by design and characterization.
9. Output-to-output skew is measured between two different outputs under identical input transitions.
10. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs
11. Random jitter is measured with a K28.7 character pattern, measured at  $\leq f_{MAX}$ .
12. Deterministic jitter is measured at 2.5Gbps/3.2Gbps, with both K28.5 and 2<sup>23</sup>-1 PRBS pattern.
13. Cycle-to-cycle jitter definition: the variation of periods between adjacent cycles,  $T_n - T_{n-1}$  where T is the time between rising edges of the output signal.
14. Total jitter definition: with an ideal clock input of frequency  $\leq f_{MAX}$ , no more than one output edge in  $10^{12}$  output edges will deviate by more than the specified peak-to-peak jitter value.
15. Crosstalk is measured at the output while applying two similar differential clock frequencies that are asynchronous with respect to each other adjacent inputs.
