NOTES:

1. Measured between pins 1 through 8 shorted together and pins 9 through 16 shorted together.
2. Measured between pins 9 and 10 or 11 and 12 shorted together, and pins 9 through 16 shorted together.
3. Measured between pins 9 and 10 shorted together, and pins 11 and 12 shorted together.
4. The t_{PLH} propagation delay is measured from the 6.5mA point on the trailing edge of the input pulse to the 1.5V point on the trailing edge of the output pulse.
5. The t_{PHL} propagation delay is measured from the 6.5mA point on the leading edge of the input pulse to the 1.5V point on the leading edge of the output pulse.
6. CM_H is the max. tolerable common mode transient to assure that the output will remain in a high logic state (i.e. $V_O > 2.0\text{V}$).
7. CM_L is the max. tolerable common mode transient to assure that the output will remain in a low logic state (i.e. $V_O < 0.8\text{V}$).
8. It is essential that a bypass capacitor (.01 to 0.1 μF ceramic) be connected from pin 1 to pin 4.
