

MC1001 thru MC1003 MC1201 thru MC1203

Provide simultaneous OR/NOR or AND/NAND output functions. These devices contain an internal bias reference insuring that the threshold point is always in the center of the transition region over the temperature range.

Emitter follower output configurations differ for these three circuits as shown in the circuit schematic.

MC1001/MC1201 CIRCUIT SCHEMATIC

MC1001 thru MC1003, MC1201 thru MC1203 (continued)

ELECTRICAL CHARACTERISTICS

Outputs without pull-down resistors
are tested with a 1.5 k Ω resistor to V_{EE} .

SWITCHING TIME TEST CIRCUIT AND WAVEFORMS @ 25°C

APPLICATIONS INFORMATION

The MC1001-1003/MC1201-1203 6-input OR/NOR gates are extremely useful in generating multiple wired-OR logic functions since six independent outputs are provided. (An example is shown in Figure 1.) The gate performs well as a clock driver with the multiple outputs which result in three times the normal fan-out for a given clock waveform. If twisted pair lines are being used for clock distribution in a system, the gate will drive three independent twisted pair lines, each with the same clock waveform.

An output impedance of about 2 ohms is obtained if three OR or NOR outputs are tied together. This provides an excellent 50-ohm driving capability. The 50-ohm line or coax should be terminated in its characteristic impedance to a nominal -2.0 V. This prevents excessively high output current that would pull the logic "1" level below nominal (see Figure 2).
