

Low Voltage Bias Stabilizer with Enable

- Maintains Stable Bias Current in N-Type Discrete Bipolar Junction and Field Effect Transistors
- Provides Stable Bias Using a Single Component Without Use of Emitter Ballast and Bypass Components
- Operates Over a Wide Range of Supply Voltages Down to 1.8 Vdc
- Reduces Bias Current Variation Due to Temperature and Unit-to-Unit Parametric Changes
- Consumes < 0.5 mW at $V_{CC} = 2.75$ V
- Active High Enable is CMOS Compatible

This device provides a reference voltage and acts as a DC feedback element around an external discrete, NPN BJT or N-Channel FET. It allows the external transistor to have its emitter/source directly grounded and still operate with a stable collector/drain DC current. It is primarily intended to stabilize the bias of discrete RF stages operating from a low voltage regulated supply, but can also be used to stabilize the bias current of any linear stage in order to eliminate emitter/source bypassing and achieve tighter bias regulation over temperature and unit variations. The "ENABLE" polarity nulls internal current, Enable current, and RF transistor current in "STANDBY." This device is intended to replace a circuit of three to six discrete components.

The combination of low supply voltage, low quiescent current drain, and small package make the MDC5001T1 ideal for portable communications applications such as:

- Cellular Telephones
- Pagers
- PCN/PCS Portables
- GPS Receivers
- PCMCIA RF Modems
- Cordless Phones
- Broadband and Multiband Transceivers and Other Portable Wireless Products

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{CC}	15	Vdc
Ambient Operating Temperature Range	T_A	-40 to +85	°C
Storage Temperature Range	T_{stg}	-65 to +150	°C
Junction Temperature	T_J	150	°C
Collector Emitter Voltage (Q2)	V_{CEO}	-15	V
Enable Voltage (Pin 5)	V_{ENBL}	V_{CC}	V

THERMAL CHARACTERISTICS

Characteristic	Symbol	Max	Unit
Total Device Power Dissipation (FR-5 PCB of 1" × 0.75" × 0.062", $T_A = 25^\circ\text{C}$) Derate above 25°C	P_D	150 1.2	mW mW/°C
Thermal Resistance, Junction to Ambient	$R_{\theta JA}$	833	°C/W

APPLICATION CIRCUITS

- Step 1: Choose V_{CC} (1.8 V Min to 10 V Max)
 Step 2: Insure that Min V_{ENBL} is $\geq$ minimum indicated in Figures 5 and 6.
 Step 3: Choose bias current, I_{C3} , and calculate needed I_{out} from typ H_{FE3}
 Step 4: From Figure 1, read V_{ref} for V_{CC} and I_{out} calculated.
 Step 5: Calculate Nominal $R5 = (V_{CC} - V_{ref}) \div (I_{C3} + I_{out})$. Tweak as desired.

**Figure 18. Class A Biasing of a Typical 900 MHz
BJT Amplifier Application**

- Step 1: Choose V_{CC} (1.8 V Min to 10 V Max)
 Step 2: Insure that Min V_{ENBL} is $\geq$ minimum indicated in Figures 5 and 6.
 Step 3: Choose bias current, I_D , and determine needed gate-source voltage, V_{GS} .
 Step 4: Choose I_{out} keeping in mind that too large an I_{out} can impair MDC5000 $\Delta V_{ref}/\Delta T_J$ performance (Figure 2) but too large an $R6$ can cause I_{DGO} & I_{GSO} to bias on the FET.
 Step 5: Calculate $R6 = (V_{GS} + E_{GS}) \div I_{out}$
 Step 6: From Figure 1, read V_{ref} for V_{CC} & I_{out} chosen
 Step 7: Calculate Nominal $R5 = (V_{CC} - V_{ref}) \div (I_D + I_{out})$. Tweak as desired.
