BIPOLAR ANALOG INTEGRATED CIRCUIT

μPC8126K

900 MHz BAND DIRECT QUADRATURE MODULATOR IC FOR DIGITAL MOBILE COMMUNICATION SYSTEMS

DESCRIPTION

The μPC8126K is a silicon monolithic integrated circuit designed as quadrature modulator for digital mobile communication systems. This IC integrates a pre-mixer for local signals plus a quadrature modulator operating from 889 MHz to 960 MHz. The chip which has been conventionally packaged in 20-pin SSOP is packaged in 28-pin QFN and therefore is suitable for higher density mounting. In addition, the IC has power save function and can operate 2.7 to 3.6 V supply voltage. Consequently the μPC8126K can contribute to make RF blocks smaller size, higher performance and lower power consumption.

FEATURES

- Directly modulate in 889 MHz to 960 MHz
- Built-in pre-mixer for local signals
- External IF filter can be applied between modulator output and pre-mixer input terminal.
- Current consumption I_{CC} = 35 mA TYP. @ V_{CC} = 3.0 V
- Equipped with power save function.
- 28-pin QFN suitable for higher density mounting.

APPLICATIONS

- Digital cellular phones: PDC800M

ORDERING INFORMATION

Part Number	Package	Supplying Form
μPC8126K-E1	28-pin plastic QFN (5.1 × 5.5 × 0.95 mm)	Embossed tape 12 mm wide. QTY 2.5 kp/reel. Pins 1 through 10 are in pull-out direction.

PIN EXPLANATIONS

Pin No.	Symbol	Supply Voltage (V)	Pin Voltage (V) @3 V	Description	Equivalent Circuit
2	LOinb	–	2.6	Bypass of LO input for modulator. This pin should be externally grounded through around 33 pF capacitor.	4	LOin	–	2.6	LO input for the phase shifter. Connect around 300 Ω between pin 4 and 5 to match to 50 Ω by LC.	
6	$V_{CC}2$	2.7 to 3.6	–	Supply voltage pin for the phase shifter and IQ Mixer. An internal regulator helps keep the device stable against temperature or V_{CC} variation.	
7	$V_{PS}1$ (Modulator)	V_{PS}	–	Power save control pin for the modulator can control On/Sleep state with bias as follows. V_{PS} (V): 2.2 to 3.6 — State: ON (Active Mode) V_{PS} (V): 0 to 0.5 — State: OFF (Sleep Mode)	9	GND (Modulator)	0	–	Ground pin for the modulator. Connect to the ground with minimum inductance. Track length should be kept as short as possible.	
10	I	$V_{CC}/2$	–	Input for I signal. This input impedance is 180 kΩ. In case of that I/Q input signals are single ended, amplitude of the signal is 500 mV_{P-P} max. **Note**	11	Ib	$V_{CC}/2$	–	Input for I signal. This input impedance is 180 kΩ. In case of that I/Q input signals are single ended, $V_{CC}/2$ biased DC signal should be input. In case of that I/Q input signals are differential, amplitude of the signal is 250 m V_{P-P} max. **Note**	

Note Relations between amplitude and $V_{CC}/2$ bias of input signal are following.

Pin No.	Symbol	Supply Voltage (V)	Pin Voltage (V) @3 V	Description	Equivalent Circuit
12	Qb	$V_{CC}/2$	–	Input for Q signal. This input impedance is 180 kΩ. In case of that I/Q input signals are single ended, $V_{CC}/2$ biased DC signal should be input. In case of that I/Q input signals are differential, amplitude of the signal is 250 mV_{P-P} max. **Note**	13	Q	$V_{CC}/2$	–	Input for Q signal. This input impedance is 180 kΩ. In case of that I/Q input signals are single ended, amplitude of the signal is 500 mV_{P-P} max. **Note**	
14	GND (Modulator)	0	–	Ground pin for the modulator. Connect to the ground with minimum inductance. Track length should be kept as short as possible.	
16	$V_{CC}3$	2.7 to 3.6	–	Supply voltage pin for the output buffer amplifier of modulator. An internal regulator helps keep the device stable against temperature or V_{CC} variation.	
17	MODout	–	1.6	Output pin from the modulator. This is emitter follower output. So this output impedance is low.	19	GND (Modulator)	0	–	Ground pin for the modulator. Connect to the ground with minimum inductance. Track length should be kept as short as possible.	
20	$V_{PS}2$ (Pre-Mix)	V_{PS}	–	Power save control pin can control the On/Sleep state with bias as follows. V_{PS} (V) / State: 2.2 to 3.6 – ON (Active Mode) 0 to 0.5 – OFF (Sleep Mode)	
Note Relations between amplitude and $V_{CC}/2$ bias of input signal are following.

Pin No.	Symbol	Supply Voltage (V)	Pin Voltage (V) @3 V	Description	Equivalent Circuit
21	IF-LOin	–	1.3	IF input pin for the Pre-Mixer. This pin is biased internally. Capacitor should be connected in series, and grounded through 51 Ω.	24	GND (Pre-Mix)	0	–	Ground pin for Pre-Mixer. Connect to the ground with minimum inductance. Track length should be kept as short as possible.	———
25	RF-LOin	–	2.3	RF input pin for the Pre-Mixer. This pin is biased internally. Capacitor should be connected in series, and grounded through 51 Ω.	26	$V_{CC}1$ (Pre-Mix)	2.7 to 3.6	–	Supply voltage pin for the Pre-Mixer. An internal regulator helps keep the device stable against temperature or V_{CC} variation.	———
27	Pre-Mixout	2.7 to 3.6	–	Output from the Pre-Mixer. This pin is designed as open collector. Due to the high impedance output, this pin should be externally equipped with LC matching circuit to next stage.	28	GND (Modulator)	0	–	Ground pin for the modulator. Connect to the ground with minimum inductance. Track length should be kept as short as possible.	———
1, 3, 5, 8, 15, 18, 22, 23	N.C.	–	–	Non connection pins.	———

EXPLANATION OF INTERNAL FUNCTION

Block	Function/Operation	Block Diagram
90° PHASE SHIFTER	Input signal from LO is send to digital circuit of T-type flip-flop through frequency doubler. Output signal from T-type F/F is changed to same frequency as LO input and that have quadrature phase shift, 0°, 90 °, 180°, 270°. These circuits have function of self phase correction to make correctly quadrature signals.	BUFFER AMP.	Buffer amplifiers for each phase signals to send to each mixers.	
MIXER	Each signals from buffer amp. are quadrature modulated with two double-balanced mixers. High accurate phase and amplitude inputs are realized to good performance for image rejection.	ADDER	Output signals from each mixers are added with adder and send to final amplifier.

NOTE ON CORRECT USE

(1) Observe precautions for handling because of electrostatic sensitive devices.
(2) Form a ground pattern as widely as possible to minimize ground impedance (to prevent undesired operation).
(3) Keep the track length between the ground pins as short as possible.
(4) Connect a bypass capacitor (example 1 000 pF) to the V_{CC} pin.

RECOMMENDED SOLDERING CONDITIONS

This product should be soldered under the following recommended condition. For soldering methods and conditions other than those recommended below, contact your NEC sales representative.

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared Reflow	Package peak temperature: 235°C or below Time: 30 seconds or less (at 210°C) Count: 2, Exposure limit[Note]: None	IR35-00-2
Partial Heating	Pin temperature: 300°C Time: 3 seconds or less (per side of device) Exposure limit[Note]: None	–

Note After opening the dry pack, keep it in a place below 25°C and 65% RH for the allowable storage period.

Caution Do not use different soldering methods together (except for partial heating).

For details of recommended soldering conditions for surface mounting, refer to information document **SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL (C10535E)**.
