LM3704/LM3705
Microprocessor Supervisory Circuits with Power Fail Input, Low Line Output and Manual Reset

General Description

The LM3704/LM3705 series of microprocessor supervisory circuits provide the maximum flexibility for monitoring power supplies and battery controlled functions in systems without backup batteries. The LM3704/LM3705 series are available in MSOP-10 and 9-bump micro SMD packages.

Built-in features include the following:

Reset: Reset is asserted during power-up, power-down, and brownout conditions. $\overline{\text{RESET}}$ is guaranteed down to V_{CC} of 1.0V.

Manual Reset Input: An input that asserts reset when pulled low.

Power-Fail Input: A 1.225V threshold detector for power fail warning, or to monitor a power supply other than V_{CC}.

Low Line Output: This early power failure warning indicator goes low when the supply voltage drops to a value which is 2% higher than the reset threshold voltage.

Features

- Standard Reset Threshold voltage: 3.08V
- Custom Reset Threshold voltages: For other voltages between 2.2V and 5.0V in 10mV increments, contact National Semiconductor Corp.
- No external components required
- Manual-Reset input
- $\overline{\text{RESET}}$ (LM3704) or RESET (LM3705) outputs
- Precision supply voltage monitor
- Factory programmable Reset Timeout Delay
- Separate Power Fail comparator
- Available in micro SMD package for minimum footprint
- ±0.5% Reset threshold accuracy at room temperature
- ±2% Reset threshold accuracy over temperature extremes
- Reset assertion down to 1V V_{CC} ($\overline{\text{RESET}}$ option only)
- 28 µA V_{CC} supply current

Applications

- Embedded Controllers and Processors
- Intelligent Instruments
- Automotive Systems
- Critical µP Power Monitoring

Pin Description

Pin No.		Name	Function
micro SMD	MSOP		
A1	2	$\overline{MR}$	Manual-Reset input. When $\overline{MR}$ is less than V_{MRT} (Manual Reset Threshold) $\overline{RESET}$/RESET is engaged.
B1	1	V_{CC}	Power Supply input.
C1	10	$\overline{RESET}$	Reset Logic Output. Pulses low for t_{RP} (Reset Timeout Period) when triggered, and stays low whenever V_{CC} is below the reset threshold or when $\overline{MR}$ is below V_{MRT}. It remains low for t_{RP} after either V_{CC} rises above the reset threshold, or after $\overline{MR}$ input rises above V_{MRT} (LM3704 only).
		RESET	Reset Logic Output. RESET is the inverse of $\overline{RESET}$ (LM3705 only).
C2	8	$\overline{PFO}$	Power-Fail Logic Output. When PFI is below V_{PFT}, $\overline{PFO}$ goes low; otherwise, $\overline{PFO}$ remains high.
C3	7	$\overline{LLO}$	Low-Line Logic Output. Early Power-Fail warning output. Low when V_{CC} falls below V_{LLOT} (Low-Line Output Threshold). This output can be used to generate an NMI (Non-Maskable Interrupt) to provide an early warning of imminent power-failure.
B3	5	GND	Ground reference for all signals.
A3	4, 6	NC	No Connect.
A2	3	PFI	Power-Fail Comparator Input. When PFI is less than V_{PFT} (Power-Fail Reset Threshold), the $\overline{PFO}$ goes low; otherwise, $\overline{PFO}$ remains high.
B2	9	NC	No Connect. Test input used at factory only. Leave floating.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. **Operating Ratings** indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed conditions.

Note 2: The Human Body model is a 100 pF capacitor discharged through a 1.5 kΩ resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

Note 3: The maximum allowable power dissipation is a function of the maximum junction temperature, T_J(MAX), the junction-to-ambient thermal resistance, θ_{J-A}, and the ambient temperature, T_A. The maximum allowable power dissipation at any ambient temperture is calculated using:

$$P(MAX) = \frac{T_J(MAX) - T_A}{\theta_{J-A}}$$

Where the value of θ_{J-A} for the MSOP-10 package is 195˚C/W in a typical PC board mounting and the micro SMD package is 220˚C/W.

Circuit Information

Reset Output

The Reset input of a µP initializes the device into a known state. The LM3704/LM3705 microprocessor supervisory circuits assert a forced reset output to prevent code execution errors during power-up, power-down, and brownout conditions.

$\overline{\text{RESET}}$ is guaranteed valid for V_{CC} > 1V. Once V_{CC} exceeds the reset threshold, an internal timer maintains the output for the reset timeout period. After this interval, reset goes high. The LM3704 offers an active-low $\overline{\text{RESET}}$; The LM3705 offers an active-high RESET.

Any time V_{CC} drops below the reset threshold (such as during a brownout), the reset activates. When V_{CC} again rises above the reset threshold, the internal timer starts. Reset holds until V_{CC} exceeds the reset threshold for longer than the reset timeout period. After this time, reset releases.

The Manual Reset input ($\overline{\text{MR}}$) will initiate a forced reset also. See the *Manual Reset Input* section.

Reset Threshold

The LM3704/LM3705 family is available with a reset voltage of 3.08V. Other reset thresholds in the 2.20V to 5.0V range, in steps of 10 mV, are available; contact National Semiconductor for details.

Manual Reset Input ($\overline{\text{MR}}$)

Many µP-based products require a manual reset capability, allowing the operator to initiate a reset. The $\overline{\text{MR}}$ input is fully debounced and provides an internal 56 kΩ pull-up. When the $\overline{\text{MR}}$ input is pulled below V_{MRT} (1.225V) for more than 25 µs, reset is asserted after a typical delay of 12 µs. Reset remains active as long as $\overline{\text{MR}}$ is held low, and releases after the reset timeout period expires after $\overline{\text{MR}}$ rises above V_{MRT}. Use $\overline{\text{MR}}$ with digital logic to assert or to daisy chain supervisory circuits. It may be used as another low-line comparator by adding a buffer.

Power-Fail Comparator (PFI/$\overline{\text{PFO}}$)

The PFI is compared to a 1.225V internal reference, V_{PFT}. If PFI is less than V_{PFT}, the Power Fail Output $\overline{\text{PFO}}$ drops low. The power-fail comparator signals a falling power supply, and is driven typically by an external voltage divider that senses either the unregulated supply or another system supply voltage. The voltage divider generally is chosen so the voltage at PFI drops below V_{PFT} several milliseconds before the main supply voltage drops below the reset threshold, providing advanced warning of a brownout.

The voltage threshold is set by R_1 and R_2 and is calculated as follows:

$$V_{PFT} = \left(\frac{R1 + R2}{R2}\right) \times 1.225V$$

Note this comparator is completely separate from the rest of the circuitry, and may be employed for other functions as needed.

Low-Line Output ($\overline{\text{LLO}}$)

The low-line output comparator is typically used to provide a non-maskable interrupt to a µP when V_{CC} begins falling. $\overline{\text{LLO}}$ monitors V_{CC} and goes low when V_{CC} falls below V_{LLOT} (typically 1.02 • V_{RST}) with hysteresis of 0.0032 • V_{RST}.

Special Precautions for the micro SMD Package

As with most integrated circuits, the LM3704 and LM3705 are sensitive to exposure from visible and infrared (IR) light radiation. Unlike a plastic encapsulated IC, the micro SMD package has very limited shielding from light, and some sensitivity to light reflected from the surface of the PC board or long wavelength IR entering the die from the side may be experienced. This light could have an unpredictable affect on the electrical performance of the IC. Care should be taken to shield the device from direct exposure to bright visible or IR light during operation.

Micro SMD Mounting

The micro SMD package requires specific mounting techniques which are detailed in National Semiconductor Application Note AN-1112. Referring to the section ***Surface Mount Technology (SMT) Assembly Considerations***, it should be noted that the pad style which must be used with the 9-pin package is the NSMD (non-solder mask defined) type.

For best results during assembly, alignment ordinals on the PC board may be used to facilitate placement of the micro SMD device.

X3 = 0.850mm

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
