# 3.3V / 5V ECL Differential Receiver/Driver with High and Low Gain

The EP16VB is a world–class differential receiver/driver. The device is functionally equivalent to the EP16 and LVEP16 devices but with both high and low gain outputs.  $Q_{HG}$  and  $\overline{Q_{HG}}$  outputs have a DC gain several times larger than the DC gain of an EP16.  $\overline{Q}$  output is provided for feedback purposes.

The  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu F$  capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open.

Special considerations are required for differential inputs under No Signal conditions to prevent instability.

The 100 Series contains temperature compensation.

Measured using a 750 mV source, 50% duty cycle clock source. All loading with 50 Ω to V<sub>CC</sub>-2.0 V.
 Skew is measured between outputs under identical transitions. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
