- Each MECL 10H series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts.

APPLICATION INFORMATION

The MC10H130 is a clocked dual D type latch. Each latch may be clocked separately by holding the common clock in the low state, and using the clock enable inputs for the clocking function. If the common clock is to be used to clock the latch, the clock enable ($\overline{CE}$) inputs must be in the low state. In this mode, the enable inputs perform the function of controlling the common clock ($\overline{C}$).

Any change at the D input will be reflected at the output while the clock is low. The outputs are latched on the

positive transition of the clock. While the clock is in the high state, a change in the information present at the data inputs will not affect the output information.

The set and reset inputs do not override the clock and D inputs. They are effective only when either $\overline{C}$ or $\overline{CE}$ or both are high.
