**LCD Drivers**

## Overview

The LC7930N, 7930NW are CMOS LSIs which incorporate 20-bit shift register, latch, and two sets of 20 LCD drivers. They also have two switching pins: one of them (channel 2) can be used as a scan-line driver (back plate) and the other (channel 1) as a segment driver. They are optimal for LCD interface with microcontroller (4 or 8 bits) or dot matrix controller circuit incorporating character generator.

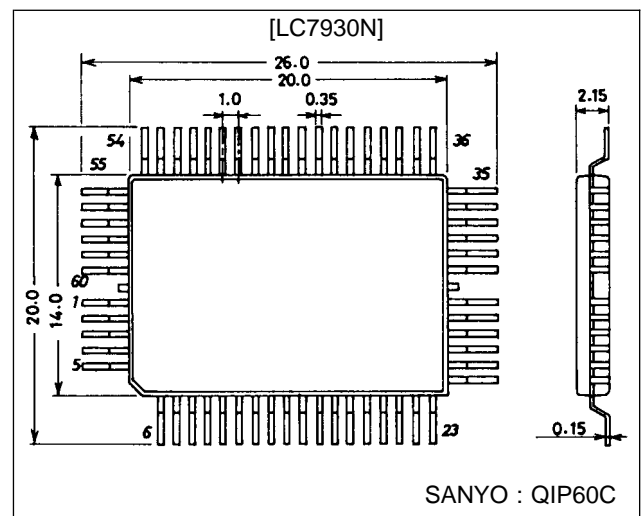

## Features

- Two channels of 20 output segment drivers
- The configuration of 20 output segment drivers + 20 scanning terminal drivers available
- A series data to connect with the microcontroller and three control signals
- Able to be connected in series for large display
- Built-in bidirectional shift register can be shifted in the direction that makes wiring easy
- Operating supply voltage/ Operating temperature:  
 $V_{DD} = 4.5 \text{ to } 5.5 \text{ V}$  /  $T_{opr} = -20 \text{ to } +75^{\circ}\text{C}$
- Operating current drain :  $I_{DD} = 1.0 \text{ mA max}$   
 (Logic = 400 kHz, LCD = 1 kHz)
- Package : Pin 60 Flat LC7930N : QIP60  
 Pin 64 Flat LC7930NW : SQFP64

## Functional Description

LC7930N, LC7930NW are serial data transfer type LCD drivers.

Data inputted serially from the data pin is shifted successively by the synchronizing clock (CLK<sub>SR</sub>) and latched by the latch clock (CLK<sub>LA</sub>) when the all data are shifted.

- Segment terminal

When CH2-BP goes to low, the data of channel 1 and channel 2 are shifted at the falling edge of CLK<sub>SR</sub>, and then latched at the falling edge of the CLK<sub>LA</sub>. The reference pulse will be switched to selected or unselected due to the latched data.

- Scan terminal

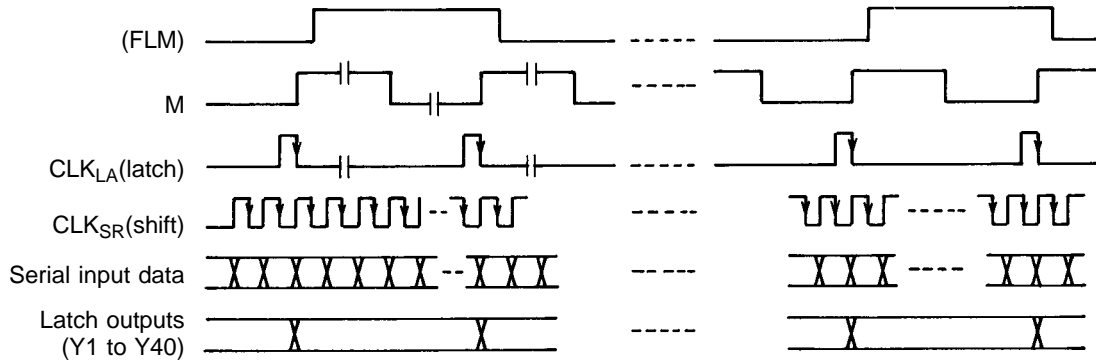

When CH2-BP goes to high, the data of channel 2 is shifted at the rising edge of CLK<sub>LA</sub>, and then latched at the rising edge of the CLK<sub>SR</sub>. When FLM signal, as a data, is inputted, the output will be scan terminal drive mode.
