

# STK16C88-3

## 32K x 8 *AutoStorePlus*™ nvSRAM

### 3.3V *QuantumTrap*™ CMOS

#### Nonvolatile Static RAM

*Preliminary*

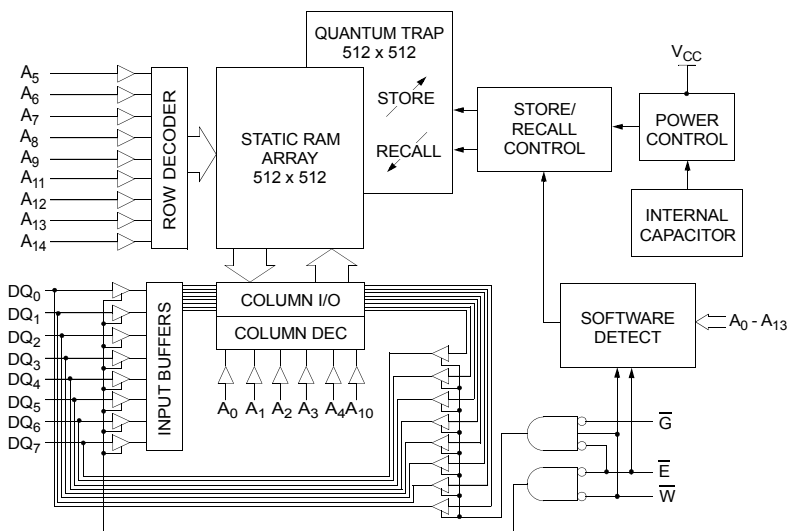

## FEATURES

- Transparent Data Save on Power Down
- Internal Capacitor Guarantees *AutoStore*™ Regardless of Power-Down Slew Rate
- Directly Replaces 32K x 8 Static RAM, Battery-Backed RAM or EEPROM
- 35, 45ns and 55ns Access Times
- *STORE* to Nonvolatile Elements Initiated by Software or *AutoStorePlus*™
- *RECALL* to SRAM Initiated by Software or Power Restore
- 10mA Typical  $I_{CC}$  at 200ns Cycle Time
- Unlimited READ, WRITE and *RECALL* Cycles
- 1,000,000 *STORE* Cycles to Nonvolatile Elements (Commercial/Industrial)
- 100-Year Data Retention in nonvolatile elements (Commercial/Industrial)
- Single 3.3V  $\pm$  0.3V Operation
- Commercial and Industrial Temperatures
- 28-Pin PDIP Package

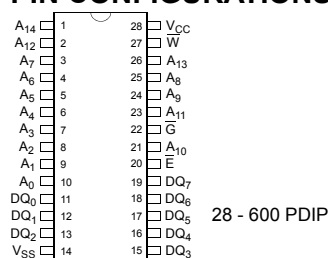

## DESCRIPTION

The STK16C88-3 is a fast SRAM with a nonvolatile element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent nonvolatile data resides in Nonvolatile Elements. Data transfers from the SRAM to the Nonvolatile Elements (the *STORE* operation) can take place automatically on power down. An internal capacitor guarantees the *STORE* operation regardless of power-down slew rate. Transfers from the Nonvolatile Elements to the SRAM (the *RECALL* operation) take place automatically on restoration of power. Initiation of *STORE* and *RECALL* cycles can also be controlled by entering control sequences on the SRAM inputs. The STK16C88-3 is pin-compatible with 32k x 8 SRAMs and battery-backed SRAMs, allowing direct substitution while providing superior performance. The STK14C88-3, which uses an external capacitor, is also available.

## BLOCK DIAGRAM

## PIN CONFIGURATIONS

## PIN NAMES

A <sub>0</sub> - A <sub>14</sub>	Address Inputs
$\overline{W}$	Write Enable
DQ <sub>0</sub> - DQ <sub>7</sub>	Data In/Out
$\overline{E}$	Chip Enable
$\overline{G}$	Output Enable
V <sub>CC</sub>	Power (+ 3.3V)
V <sub>SS</sub>	Ground

## ABSOLUTE MAXIMUM RATINGS<sup>a</sup>

Voltage on Input Relative to Ground . . . . . -0.5V to 4.5V  
 Voltage on Input Relative to  $V_{SS}$  . . . . . -0.6V to ( $V_{CC} + 0.5V$ )  
 Voltage on DQ<sub>0-7</sub> . . . . . -0.5V to ( $V_{CC} + 0.5V$ )  
 Temperature under Bias . . . . . -55°C to 125°C  
 Storage Temperature . . . . . -65°C to 150°C  
 Power Dissipation . . . . . 1W  
 DC Output Current (1 output at a time, 1s duration) . . . . . 15mA

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC CHARACTERISTICS

( $V_{CC} = 3.0V-3.6V$ )

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
$I_{CC1}^b$	Average $V_{CC}$ Current		50 42 37		52 44 39	mA	$t_{AVAV} = 35ns$ $t_{AVAV} = 45ns$ $t_{AVAV} = 55ns$
$I_{CC2}^c$	Average $V_{CC}$ Current during <i>STORE</i>		3		3	mA	All Inputs Don't Care, $V_{CC} = \max$
$I_{CC3}^b$	Average $V_{CC}$ Current at $t_{AVAV} = 200ns$ 3.3V, 25°C, Typical		8		8	mA	$\overline{W} \geq (V_{CC} - 0.2V)$ All Others Cycling, CMOS Levels
$I_{SB1}^d$	Average $V_{CC}$ Current (Standby, Cycling TTL Input Levels)		18 16 15		19 17 16	mA	$t_{AVAV} = 35ns$ , $\overline{E} \geq V_{IH}$ $t_{AVAV} = 45ns$ , $\overline{E} \geq V_{IH}$ $t_{AVAV} = 55ns$ , $\overline{E} \geq V_{IH}$
$I_{SB2}^d$	$V_{CC}$ Standby Current (Standby, Stable CMOS Input Levels)		1		1	mA	$\overline{E} \geq (V_{CC} - 0.2V)$ All Others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
$I_{ILK}$	Input Leakage Current		$\pm 1$		$\pm 1$	$\mu A$	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to $V_{CC}$
$I_{OLK}$	Off-State Output Leakage Current		$\pm 1$		$\pm 1$	$\mu A$	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to $V_{CC}$ , $\overline{E}$ or $\overline{G} \geq V_{IH}$
$V_{IH}$	Input Logic "1" Voltage	2.2	$V_{CC} + .5$	2.2	$V_{CC} + .5$	V	All Inputs
$V_{IL}$	Input Logic "0" Voltage	$V_{SS} - .5$	0.8	$V_{SS} - .5$	0.8	V	All Inputs
$V_{OH}$	Output Logic "1" Voltage	2.4		2.4		V	$I_{OUT} = -4mA$
$V_{OL}$	Output Logic "0" Voltage		0.4		0.4	V	$I_{OUT} = 8mA$
$T_A$	Operating Temperature	0	70	-40	85	°C	

Note b:  $I_{CC1}$  and  $I_{CC3}$  are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.

Note c:  $I_{CC2}$  and  $I_{CC4}$  are the average currents required for the duration of the respective *STORE* cycles ( $t_{STORE}$ ).

Note d:  $\overline{E} \geq V_{IH}$  will not produce standby current levels until any nonvolatile cycle in progress has timed out.

## AC TEST CONDITIONS

Input Pulse Levels . . . . . 0V to 3V  
 Input Rise and Fall Times . . . . .  $\leq 5ns$   
 Input and Output Timing Reference Levels . . . . . 1.5V  
 Output Load . . . . . See Figure 1

## CAPACITANCE<sup>e</sup> ( $T_A = 25^\circ C$ , $f = 1.0MHz$ )

SYMBOL	PARAMETER	MAX	UNITS	CONDITIONS
$C_{IN}$	Input Capacitance	5	pF	$\Delta V = 0$ to 3V
$C_{OUT}$	Output Capacitance	7	pF	$\Delta V = 0$ to 3V

Note e: These parameters are guaranteed but not tested.

Note i: If  $\overline{W}$  is low when  $\overline{E}$  goes low, the outputs remain in the high-impedance state.Note j:  $\overline{E}$  or  $\overline{W}$  must be  $\geq V_{IH}$  during address transitions.SRAM WRITE CYCLE #1:  $\overline{W}$  Controlled<sup>j</sup>SRAM WRITE CYCLE #2:  $\overline{E}$  Controlled<sup>j</sup>

Note k:  $t_{\text{RESTORE}}$  starts from the time  $V_{\text{CC}}$  rises above  $V_{\text{SWITCH}}$ .

The diagram shows the timing relationship between  $V_{CC}$ ,  $V_{SWITCH}$ ,  $V_{RESET}$ ,  $AutoStore^{TM}$ ,  $POWER-UP\ RECALL$ , and  $DQ\ (DATA\ OUT)$ . The  $AutoStore^{TM}$  signal is active-low. The  $POWER-UP\ RECALL$  signal is active-low and occurs when  $V_{CC}$  rises above  $V_{SWITCH}$ . The  $DQ\ (DATA\ OUT)$  signal is shown as a series of data bytes. The timing parameters  $t_{STORE}$ ,  $t_{STG}$ ,  $t_{RESTORE}$ , and  $t_{SWITCH}$  are indicated.

Four scenarios are illustrated below the diagram:

- POWER-UP RECALL**:  $V_{CC}$  rises above  $V_{SWITCH}$ , and the recall pulse occurs.
- BROWN OUT NO STORE DUE TO NO SRAM WRITES**:  $V_{CC}$  drops below  $V_{RESET}$ , and no store occurs.
- BROWN OUT NO RECALL**:  $V_{CC}$  drops below  $V_{RESET}$ , and no recall occurs.
- BROWN OUT RECALL WHEN  $V_{CC}$  RETURNS ABOVE  $V_{SWITCH}$** :  $V_{CC}$  drops below  $V_{RESET}$ , then returns above  $V_{SWITCH}$ , and recall occurs.

SOFTWARE STORE/RECALL MODE SELECTION

$\overline{E}$	$\overline{W}$	A <sub>13</sub> - A <sub>0</sub> (hex)	MODE	I/O	NOTES

Note n: The software sequence is clocked with  $\overline{E}$  controlled reads.  
Note o: The six consecutive addresses must be in the order listed in the Software *STORE/RECALL* Mode Selection Table: (0E38, 31C7, 03E0, 3C1F, 303F, 0FC0) for a *STORE* cycle or (0E38, 31C7, 03E0, 3C1F, 303F, 0C63) for a *RECALL* cycle.  $\overline{W}$  must be high during all six consecutive cycles.

SOFTWARE STORE/RECALL CYCLE:  $\overline{E}$  Controlled<sup>o</sup>

## DEVICE OPERATION

The *AutoStorePlus*™ STK16C88-3 is a fast 32K x 8 SRAM that does not lose its data on power-down. The data is preserved in integral *QuantumTrap*™ Nonvolatile Elements while power is unavailable. The nonvolatility of the STK16C88-3 does not require any system intervention or support: *AutoStorePlus*™ on power-down and automatic *RECALL* on power-up guarantee data integrity without the use of batteries.

### NOISE CONSIDERATIONS

Note that the STK16C88-3 is a high-speed memory and so must have a high-frequency bypass capacitor of approximately 0.1μF connected between  $V_{CC}$  and  $V_{SS}$ , using leads and traces that are as short as possible. As with all high-speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

### SRAM READ

The STK16C88-3 performs a READ cycle whenever  $\bar{E}$  and  $\bar{G}$  are low and  $\bar{W}$  is high. The address specified on pins  $A_{0-14}$  determines which of the 32,768 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of  $t_{AVQV}$  (READ cycle #1). If the READ is initiated by  $\bar{E}$  or  $\bar{G}$ , the outputs will be valid at  $t_{ELQV}$  or at  $t_{GLQV}$ , whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the  $t_{AVQV}$  access time without the need for transitions on any control input pins, and will remain valid until another address change or until  $\bar{E}$  or  $\bar{G}$  is brought high.

### SRAM WRITE

A WRITE cycle is performed whenever  $\bar{E}$  and  $\bar{W}$  are low. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\bar{E}$  or  $\bar{W}$  goes high at the end of the cycle. The data on the common I/O pins  $DQ_{0-7}$  will be written into the memory if it is valid  $t_{DWWH}$  before the end of a  $\bar{W}$  controlled WRITE or  $t_{DVEH}$  before the end of an  $\bar{E}$  controlled WRITE.

It is recommended that  $\bar{G}$  be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If  $\bar{G}$  is left low, internal circuitry will turn off the output buffers  $t_{WLQZ}$  after  $\bar{W}$  goes low.

### *AutoStorePlus*™ OPERATION

The STK16C88-3's automatic *STORE* on power-down is completely transparent to the system. The *AutoStore*™ initiation takes less than 500ns when power is lost ( $V_{CC} < V_{SWITCH}$ ) at which point the part depends only on its internal capacitor for *STORE* completion. If the power supply drops faster than 20μs/volt before  $V_{CCX}$  reaches  $V_{SWITCH}$ , then a 2.2 ohm resistor should be inserted between  $V_{CCX}$  and the system supply to avoid a momentary excess of current between  $V_{CCX}$  and  $V_{CAP}$ .

In order to prevent unneeded *STORE* operations, automatic *STORE*s will be ignored unless at least one WRITE operation has taken place since the most recent *STORE* or *RECALL* cycle. Software-initiated *STORE* cycles are performed regardless of whether or not a WRITE operation has taken place.

### POWER-UP RECALL

During power up, or after any low-power condition ( $V_{CC} < V_{RESET}$ ), an internal *RECALL* request will be latched. When  $V_{CC}$  once again exceeds the sense voltage of  $V_{SWITCH}$ , a *RECALL* cycle will automatically be initiated and will take  $t_{RESTORE}$  to complete.

If the STK16C88-3 is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10kΩ resistor should be connected either between  $\bar{W}$  and system  $V_{CC}$  or between  $\bar{E}$  and system  $V_{CC}$ .

### SOFTWARE NONVOLATILE STORE

The STK16C88-3 software *STORE* cycle is initiated by executing sequential READ cycles from six specific address locations. During the *STORE* cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. The program operation copies the SRAM data into nonvolatile memory. Once a *STORE* cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of READs from specific addresses is used for *STORE* initiation, it is important that no other READ or WRITE accesses intervene in the sequence or the sequence will be aborted and no *STORE* or *RECALL* will take place.

To initiate the software *STORE* cycle, the following READ sequence must be performed:

1. Read address	0E38 (hex)	Valid READ
2. Read address	31C7 (hex)	Valid READ
3. Read address	03E0 (hex)	Valid READ
4. Read address	3C1F (hex)	Valid READ
5. Read address	303F (hex)	Valid READ
6. Read address	0FC0 (hex)	Initiate <i>STORE</i> cycle

The software sequence must be clocked with  $\overline{E}$  controlled READs.

Once the sixth address in the sequence has been entered, the *STORE* cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that  $\overline{G}$  be low for the sequence to be valid. After the  $t_{STORE}$  cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

## SOFTWARE NONVOLATILE *RECALL*

A software *RECALL* cycle is initiated with a sequence of READ operations in a manner similar to the software *STORE* initiation. To initiate the *RECALL* cycle, the following sequence of READ operations must be performed:

1. Read address	0E38 (hex)	Valid READ
2. Read address	31C7 (hex)	Valid READ
3. Read address	03E0 (hex)	Valid READ
4. Read address	3C1F (hex)	Valid READ
5. Read address	303F (hex)	Valid READ
6. Read address	0C63 (hex)	Initiate <i>RECALL</i> cycle

Internally, *RECALL* is a two-step procedure. First, the SRAM data is cleared, and second, the nonvola-

tile information is transferred into the SRAM cells. After the  $t_{RECALL}$  cycle time the SRAM will once again be ready for READ and WRITE operations. The *RECALL* operation in no way alters the data in the Nonvolatile Elements. The nonvolatile data can be recalled an unlimited number of times.

## HARDWARE PROTECT

The STK16C88-3 offers hardware protection against inadvertent *STORE* operation and SRAM WRITES during low-voltage conditions. When  $V_{CC} < V_{SWITCH}$ , all software *STORE* operations and SRAM WRITES are inhibited.

## LOW AVERAGE ACTIVE POWER

The STK16C88-3 draws significantly less current when it is cycled at times longer than 55ns. Figure 2 shows the relationship between  $I_{CC}$  and READ cycle time. Worst-case current consumption is shown for both CMOS and TTL input levels (commercial temperature range,  $V_{CC} = 3.6V$ , 100% duty cycle on chip enable). Figure 3 shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the STK16C88-3 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READs to WRITES; 5) the operating temperature; 6) the  $V_{CC}$  level; and 7) I/O loading.
