

SP3223U/3243U

High Speed Intelligent +3.0V to +5.5V RS-232 Transceivers

- Meets true EIA/TIA-232-F Standards from a +3.0V to +5.5V power supply
- Interoperable with EIA/TIA-232 and adheres to EIA/TIA-562 down to a +2.7V power source
- **AUTO ON-LINE**® circuitry automatically wakes up from a 1 μ A shutdown
- Regulated Charge Pump Yields Stable RS-232 Outputs Regardless of V_{CC} Variations
- ESD Specifications:
 - +2kV Human Body Model
- 1000 Kbps minimum transmission rate
- Ideal for High Speed RS-232 Applications

Now Available in Lead Free Packaging

DESCRIPTION

The SP3223U and SP3243U products are RS-232 transceiver solutions intended for portable or hand-held applications such as notebook and palmtop computers. The "U" series is based on Sipex's SP3223/SP3243 series and has been enhanced for high speed. The data rate is improved to 1000kbps, easily meeting the demands of high speed RS-232 applications. The SP3223U and SP3243U use an internal high-efficiency, charge-pump power supply that requires only 0.1 μ F capacitors in 3.3V operation. This charge pump and Sipex's driver architecture allow the SP3223U/SP3243U series to deliver compliant RS-232 performance from a single power supply ranging from +3.0V to +5.5V. The SP3223U is a 2-driver/2-receiver device, and the SP3243U is a 3-driver/5-receiver device, ideal for laptop/notebook computer and PDA applications. The SP3243U includes one complementary receiver that remains alert to monitor an external device's Ring Indicate signal while the device is shutdown.

The AUTO ON-LINE® feature allows the device to automatically "wake-up" during a shutdown state when an RS-232 cable is connected and a connected peripheral is turned on. Otherwise, the device automatically shuts itself down drawing less than 1 μ A.

SELECTION TABLE

Device	Power Supplies	RS-232 Drivers	RS-232 Receivers	External Components	Auto-Online Circuitry	TTL 3-State	No. of Pins
SP3223U	+3.0V to +5.5V	2	2	4 capacitors	YES	YES	20
SP3243U	+3.0V to +5.5V	3	5	4 capacitors	YES	YES	28

Applicable U.S. Patents - 5,306,954; and other patents pending.

ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability and cause permanent damage to the device.

V_{CC}-0.3V to +6.0V
 $V+$ (NOTE 1).....-0.3V to +7.0V
 $V-$ (NOTE 1).....+0.3V to -7.0V
 $V+ + IV-I$ (NOTE 1).....+13V
 I_{CC} (DC V_{CC} or GND current)..... ± 100 mA

Input Voltages

$TxIN$, $\overline{ONLINE}$,
 SHUTDOWN, $\overline{EN}$ (SP3223U).....-0.3V to +6.0V
 $RxIN$ ± 25 V

DESCRIPTION

The SP3223U and SP3243U transceivers meet the EIA/TIA-232 and ITU-T V.28/V.24 communication protocols and can be implemented in battery-powered, portable, or hand-held applications such as notebook or palmtop computers. The SP3223U and SP3243U devices feature Sipex's proprietary and patented (U.S.-- 5,306,954) on-board charge pump circuitry that generates $\pm 5.5V$ RS-232 voltage levels from a single $+3.0V$ to $+5.5V$ power supply. The SP3223U and SP3243U devices can operate at a data rate of 1000kbps fully loaded.

The SP3223U is a 2-driver/2-receiver device, and the SP3243U is a 3-driver/5-receiver device, ideal for portable or hand-held applications. The SP3243U includes one complementary always-active receiver that can monitor an external device (such as a modem) in shutdown. This aids in protecting the UART or serial controller IC by preventing forward biasing of the protection diodes where V_{CC} may be disconnected.

Figure 16. Interface Circuitry Controlled by Microprocessor Supervisory Circuit

The SP3223U and SP3243U series is an ideal choice for power sensitive designs. The SP3223U and SP3243U devices feature AUTO ON-LINE[®] circuitry which reduces the power supply drain to a $1\mu A$ supply current. In many portable or hand-held applications, an RS-232 cable can be disconnected or a connected peripheral can be turned off. Under these conditions, the internal charge pump and the drivers will be shut down. Otherwise, the system automatically comes online. This feature allows design engineers to address power saving concerns without major design changes.

THEORY OF OPERATION

The SP3223U and SP3243U series is made up of four basic circuit blocks:

1. Drivers
2. Receivers
3. the Sipex proprietary charge pump, and
4. AUTO ON-LINE[®] circuitry.

Drivers

The drivers are inverting level transmitters that convert TTL or CMOS logic levels to $5.0V$ EIA/TIA-232 levels with an inverted sense relative to the input logic levels. Typically, the RS-232 output voltage swing is $\pm 5.4V$ with no load and $\pm 5V$ minimum fully loaded. The driver outputs are protected against infinite short-circuits to ground without degradation in reliability. These drivers comply with the EIA-TIA-232-F and all previous RS-232 versions. Unused drivers inputs should be connected to GND or V_{CC} .

The drivers have a minimum data rate of 1000kbps fully loaded with $3k\Omega$ in parallel with $250pF$, ensuring compatibility with PC-to-PC communication software.

DEVICE: SP3223U			
$\overline{\text{SHUTDOWN}}$	$\overline{\text{EN}}$	$\text{T}_\text{x}\text{OUT}$	$\text{R}_\text{x}\text{OUT}$
0	0	High Z	Active
0	1	High Z	High Z
1	0	Active	Active
1	1	Active	High Z

DEVICE: SP3243U			
$\overline{\text{SHUTDOWN}}$	$\text{T}_\text{x}\text{OUT}$	$\text{R}_\text{x}\text{OUT}$	$\overline{\text{R}_2\text{OUT}}$
0	High Z	High Z	Active
1	Active	Active	Active

Table 2. $\overline{\text{SHUTDOWN}}$ and $\overline{\text{EN}}$ Truth Tables

Note: In **AUTO ON-LINE®** Mode where $\overline{\text{ONLINE}} = \text{GND}$ and $\overline{\text{SHUTDOWN}} = \text{V}_{\text{CC}}$ the device will shut down if there is no activity present at the Receiver inputs.

Figure 17 shows a loopback test circuit used to test the RS-232 Drivers. Figure 18 shows the test results where one driver was active at 1Mbps and all three drivers loaded with an RS-232 receiver in parallel with a 250pF capacitor. Figure 19 shows the test results of the loopback circuit with all drivers active at 250kbps with typical RS-232 loads in parallel with 1000pF capacitors. A superior RS-232 data transmission rate of 1Mbps makes the SP3223U/3243U series an ideal match

Figure 18. Loopback Test results at 1Mbps

Figure 17. Loopback Test Circuit for RS-232 Driver Data Transmission Rates

for high speed LAN and personal computer peripheral applications.

Receivers

The receivers convert $\pm 5.0\text{V}$ EIA/TIA-232 levels to TTL or CMOS logic output levels. The SP3223U receivers have an inverting output that can be disabled by using the $\overline{\text{EN}}$ pin.

Figure 19. Loopback Test results at 250Kbps

Receivers are active when the AUTO ON-LINE® circuitry is enabled or when in shutdown. During the shutdown, the receivers will continue to be active. If there is no activity present at the receivers for a period longer than 100μs or when SHUTDOWN is enabled, the device goes into a standby mode where the circuit draws 1μA. Driving EN to a logic HIGH forces the outputs of the receivers into high-impedance. The truth table logic of the SP3223U and SP3243U driver and receiver outputs can be found in Table 2.

The SP3243U includes an additional non-inverting receiver with an output R₃OUT. R₃OUT is an extra output that remains active and monitors activity while the other receiver outputs are forced into high impedance. This allows Ring Indicator (RI) from a peripheral to be monitored without forward biasing the TTL/CMOS inputs of the other devices connected to the receiver outputs.

Since receiver input is usually from a transmission line where long cable lengths and system interference can degrade the signal, the inputs have a typical hysteresis margin of 300mV. This ensures that the receiver is virtually immune to noisy transmission lines. Should an input be left unconnected, an internal 5KΩ pulldown resistor to ground will commit the output of the receiver to a HIGH state.

Charge Pump

The charge pump is a Sipex-patented design (U.S. 5,306,954) and uses a unique approach compared to older less-efficient designs. The charge pump still requires four external capacitors, but uses a four-phase voltage shifting technique to attain symmetrical 5.5V power supplies. The internal power supply consists of a regulated dual charge pump that provides output voltages 5.5V regardless of the input voltage (V_{CC}) over the +3.0V to +5.5V range. This is important to maintain compliant RS-232 levels regardless of power supply fluctuations.

The charge pump operates in a discontinuous mode using an internal oscillator. If the output voltages are less than a magnitude of 5.5V, the charge pump is enabled. If the output voltages exceed a magnitude of 5.5V, the charge pump is disabled. This oscillator controls the four phases of the voltage shifting. A description of each phase follows.

Phase 1

— V_{SS} charge storage — During this phase of the clock cycle, the positive side of capacitors C_1 and C_2 are initially charged to V_{CC} . C_1^+ is then switched to GND and the charge in C_1^- is transferred to C_2^- . Since C_2^+ is connected to V_{CC} , the voltage potential across capacitor C_2 is now 2 times V_{CC} .

Phase 2

— V_{SS} transfer — Phase two of the clock connects the negative terminal of C_2 to the V_{SS} storage capacitor and the positive terminal of C_2 to GND. This transfers a negative generated voltage to C_3 . This generated voltage is regulated to a minimum voltage of -5.5V. Simultaneous with the transfer of the voltage to C_3 , the positive side of capacitor C_1 is switched to V_{CC} and the negative side is connected to GND.

Phase 3

— V_{DD} charge storage — The third phase of the clock is identical to the first phase — the charge transferred in C_1 produces $-V_{CC}$ in the negative terminal of C_1 , which is applied to the negative side of capacitor C_2 . Since C_2^+ is at V_{CC} , the voltage potential across C_2 is 2 times V_{CC} .

Phase 4

— V_{DD} transfer — The fourth phase of the clock connects the negative terminal of C_2 to GND, and transfers this positive generated voltage across C_2 to C_4 , the V_{DD} storage capacitor. This voltage is regulated to +5.5V. At this voltage, the internal oscillator is disabled. Simultaneous with the transfer of the voltage to C_4 , the positive side of capacitor C_1 is switched to V_{CC} and the negative side is connected to GND, allowing the charge pump cycle to begin again. The charge pump cycle will continue as long as the operational conditions for the internal oscillator are present.

Since both V^+ and V^- are separately generated

from V_{CC} , in a no-load condition V^+ and V^- will be symmetrical. Older charge pump approaches that generate V^- from V^+ will show a decrease in the magnitude of V^- compared to V^+ due to the inherent inefficiencies in the design.

The clock rate for the charge pump typically operates at 250kHz. The external capacitors can be as low as 0.1 μ F with a 16V breakdown voltage rating.

Table 3. AUTO ON-LINE® Logic

Figure 28. Stage I of AUTO ON-LINE® Circuitry

Figure 29. Stage II of AUTO ON-LINE® Circuitry

AUTO ON-LINE® Circuitry

The SP3223U and SP3243U devices have a patent pending AUTO ON-LINE® circuitry on board that saves power in applications such as laptop computers, palmtop (PDA) computers and other portable systems.

The SP3223U and SP3243U devices incorporate an AUTO ON-LINE® circuit that automatically enables itself when the external transmitters are enabled and the cable is connected. Conversely, the AUTO ON-LINE® circuit also disables most of the internal circuitry when the device is not being used and goes into a standby mode where the device typically draws 1mA. This function can also be externally controlled by the ONLINE pin. When this pin is tied to a logic LOW, the AUTO ON-LINE® function is active. Once active, the device is enabled until there is no activity on the receiver inputs. The receiver input typically sees at least $\pm 3V$, which are generated from the transmitters at the other end of the cable with a $\pm 5V$ minimum. When the external transmitters are disabled or the cable is disconnected, the receiver inputs will be pulled down by their internal $5k\Omega$ resistors to ground. When this occurs over a period of time, the internal transmitters will be disabled and the device goes into a shutdown or standby mode. When ONLINE is HIGH, the AUTO ON-LINE® mode is disabled.

The AUTO ON-LINE® circuit has two stages:

- 1) Inactive Detection
- 2) Accumulated Delay

The first stage, shown in Figure 28, detects an inactive input. A logic HIGH is asserted on R_{xINACT} if the cable is disconnected or the external transmitters are disabled. Otherwise, R_{xINACT} will be at a logic LOW. This circuit is duplicated for each of the other receivers.

The second stage of the AUTO ON-LINE® circuitry, shown in Figure 29, processes all the receiver's R_{xINACT} signals with an accumulated delay that disables the device to a $1\mu A$ supply current.

The STATUS pin goes to a logic LOW when the cable is disconnected, the external transmitters are disabled, or the SHUTDOWN pin is invoked. The typical accumulated delay is around $20\mu s$.

When the SP3223U and SP3243U drivers or internal charge pump are disabled, the supply current is reduced to $1\mu A$. This can commonly occur in hand-held or portable applications where the RS-232 cable is disconnected or the RS-232 drivers of the connected peripheral are turned off.

The AUTO ON-LINE® mode can be disabled by the SHUTDOWN pin. If this pin is a logic LOW, the AUTO ON-LINE® function will not operate regardless of the logic state of the ONLINE pin. Table 3 summarizes the logic of the AUTO ON-LINE® operating modes. The truth table logic of the SP3223U and SP3243U driver and receiver outputs can be found in Table 2.

The STATUS pin outputs a logic LOW signal if the device is shutdown. This pin goes to a logic HIGH when the external transmitters are enabled and the cable is connected.

When the SP3223U and SP3243U devices are shut down, the charge pumps are turned off. $V+$ charge pump output decays to V_{CC} , the $V-$ output decays to GND. The decay time will depend on the size of capacitors used for the charge pump. Once in shutdown, the time required to exit the shut down state and have valid $V+$ and $V-$ levels is typically $200\mu s$.

For easy programming, the STATUS can be used to indicate DTR or a Ring Indicator signal. Tying ONLINE and SHUTDOWN together will bypass the AUTO ON-LINE® circuitry so this connection acts like a shutdown input pin.

ESD TOLERANCE

The SP3223U/3243U series incorporates ruggedized ESD cells on all driver output and receiver input pins. The ESD structure is improved over our previous family for more rugged applications and environments sensitive to electro-static discharges and associated transients.

The Human Body Model has been the generally accepted ESD testing method for semi-conductors. This method is also specified in MIL-STD-883, Method 3015.7 for ESD testing. The premise of this ESD test is to simulate the human body's potential to store electro-static energy and discharge it to an integrated circuit. The simulation is performed by using a test model as shown in Figure 30. This method will test the IC's capability to withstand an ESD transient during normal handling such as in manufacturing areas where the ICs tend to be handled frequently.

For the Human Body Model, the current limiting resistor (R_s) and the source capacitor (C_s) are $1.5k\Omega$ and $100pF$, respectively.

32 PIN QFN

Part Number	Temperature Range	Package Types
SP3223UCP	0°C to +70°C	20-pin PDIP
SP3223UCA	0°C to +70°C	20-pin SSOP
SP3223UCA/TR	0°C to +70°C	20-pin SSOP
SP3223UCY	0°C to +70°C	20-pin TSSOP
SP3223UCY/TR	0°C to +70°C	20-pin TSSOP
SP3243UCT	0°C to +70°C	28-pin WSOIC
SP3243UCT/TR	0°C to +70°C	28-pin WSOIC
SP3243UCA	0°C to +70°C	28-pin SSOP
SP3243UCA/TR	0°C to +70°C	28-pin SSOP
SP3243UCY	0°C to +70°C	28-pin TSSOP
SP3243UCY/TR	0°C to +70°C	28-pin TSSOP
SP3243UCR	0°C to +70°C	32-pin QFN
SP3243UCR/TR	0°C to +70°C	32-pin QFN
SP3223UEP	-40°C to +85°C	20-pin PDIP
SP3223UEA	-40°C to +85°C	20-pin SSOP
SP3223UEA/TR	-40°C to +85°C	20-pin SSOP
SP3223UEY	-40°C to +85°C	20-pin TSSOP
SP3223UEY/TR	-40°C to +85°C	20-pin TSSOP
SP3243UET	-40°C to +85°C	28-pin WSOIC
SP3243UET/TR	-40°C to +85°C	28-pin WSOIC
SP3243UEA	-40°C to +85°C	28-pin SSOP
SP3243UEA/TR	-40°C to +85°C	28-pin SSOP
SP3243UEY	-40°C to +85°C	28-pin TSSOP
SP3243UEY/TR	-40°C to +85°C	28-pin TSSOP
SP3243UER	-40°C to +85°C	32-pin QFN
SP3243UER/TR	-40°C to +85°C	32-pin QFN

Available in lead free packaging. To order add "-L" suffix to part number.

Example: SP3243UER/TR = standard; SP3243UER-L/TR = lead free

/TR = Tape and Reel

Pack quantity is 1,500 for SSOP, TSSOP and WSOIC.

REVISION HISTORY

DATE	REVISION	DESCRIPTION
5/25/04	A	Replaced MLPQ package with QFN.
