

**Diagonal 4.5mm (Type 1/4) CCD Image Sensor for EIA B/W Video Cameras**

**Description**

The ICX278AL is an interline CCD solid-state image sensor suitable for EIA B/W video cameras with a diagonal 4.5mm (Type 1/4) system. Compared with the current product ICX208AL, basic characteristics such as sensitivity, smear and dynamic range are improved drastically from visible light region to near infrared light region through the adoption of EXview HAD CCD™ technology.

This chip features a field period readout system and an electronic shutter with variable charge-storage time.

The package is a 10mm-square 14-pin DIP (Plastic).

**Features**

- Sensitivity in near infrared light region (+5dB compared with the ICX208AL,  $\lambda = 945\text{nm}$ )
- High sensitivity (+6dB compared with the ICX208AL, no IR cut filter)
- Low smear (-20dB compared with the ICX208AL)
- High D range (+2dB compared with the ICX208AL)
- Horizontal register: 3.3 to 5V drive
- Reset gate: 3.3 to 5V drive
- No voltage adjustment (Reset gate and substrate bias are not adjusted.)
- High resolution and low smear
- Excellent antiblooming characteristics
- Continuous variable-speed shutter
- Recommended range of exit pupil distance: -20 to -100mm

**Optical black position (Top View)**

**Device Structure**

- Interline CCD image sensor
- Image size: Diagonal 4.5mm (Type 1/4)
- Number of effective pixels: 768 (H) × 494 (V) approx. 380K pixels
- Total number of pixels: 811 (H) × 508 (V) approx. 410K pixels
- Chip size: 4.43mm (H) × 3.69mm (V)
- Unit cell size: 4.75 $\mu\text{m}$  (H) × 5.55 $\mu\text{m}$  (V)
- Optical black: Horizontal (H) direction: Front 3 pixels, rear 40 pixels  
Vertical (V) direction: Front 12 pixels, rear 2 pixels
- Number of dummy bits: Horizontal 22  
Vertical 1 (even fields only)
- Substrate material: Silicon

**EXview HAD CCD™**

\* EXview HAD CCD is a trademark of Sony Corporation.

EXview HAD CCD is a CCD that drastically improves light efficiency by including near infrared light region as a basic structure of HAD (Hole-Accumulation-Diode) sensor.

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

**Block Diagram and Pin Configuration**

**Pin Description**

Pin No.	Symbol	Description	Pin No.	Symbol	Description
1	Vφ4	Vertical register transfer clock	8	VDD	Supply voltage
2	Vφ3	Vertical register transfer clock	9	GND	GND
3	Vφ2	Vertical register transfer clock	10	φSUB	Substrate clock
4	Vφ1	Vertical register transfer clock	11	VL	Protective transistor bias
5	NC		12	RG	Reset gate clock
6	GND	GND	13	Hφ1	Horizontal register transfer clock
7	VOUT	Signal output	14	Hφ2	Horizontal register transfer clock

**Absolute Maximum Ratings**

Item		Ratings	Unit	Remarks
Against φSUB	VDD, VOUT, RG – φSUB	-40 to +8	V	
	Vφ1, Vφ3 – φSUB	-50 to +15	V	
	Vφ2, Vφ4, VL – φSUB	-50 to +0.3	V	
	Hφ1, Hφ2, GND – φSUB	-40 to +0.3	V	
Against GND	VDD, VOUT, RG – GND	-0.3 to +18	V	
	Vφ1, Vφ2, Vφ3, Vφ4 – GND	-10 to +18	V	
	Hφ1, Hφ2 – GND	-10 to +6	V	
Against VL	Vφ1, Vφ3 – VL	-0.3 to +28	V	
	Vφ2, Vφ4, Hφ1, Hφ2, GND – VL	-0.3 to +15	V	
Between input clock pins	Voltage difference between vertical clock input pins	to +15	V	*1
	Hφ1 – Hφ2	-5 to +5	V	
	Hφ1, Hφ2 – Vφ4	-13 to +13	V	
Storage temperature		-30 to +80	°C	
Operating temperature		-10 to +60	°C	

\*1 +24V (Max.) when clock width < 10μs, clock duty factor < 0.1%.

**Bias Conditions**

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Supply voltage	V <sub>DD</sub>	14.55	15.0	15.45	V	
Protective transistor bias	V <sub>L</sub>	*1				
Substrate clock	φ <sub>SUB</sub>	*2				
Reset gate clock	φ <sub>RG</sub>	*2				

\*1 V<sub>L</sub> setting is the V<sub>VL</sub> voltage of the vertical transfer clock waveform, or the same power supply as the V<sub>L</sub> power supply for the V driver should be used.

\*2 Do not apply a DC bias to the substrate clock and reset gate clock pins, because a DC bias is generated within the CCD.

**DC Characteristics**

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks

Reset gate clock series resistor	$R\phi RG$		51		$\Omega$	

**Vertical transfer clock equivalent circuit**

**Horizontal transfer clock equivalent circuit**

**Reset gate clock equivalent circuit**

Drive Clock Waveform Conditions

(1) Readout clock waveform

(2) Vertical transfer clock waveform

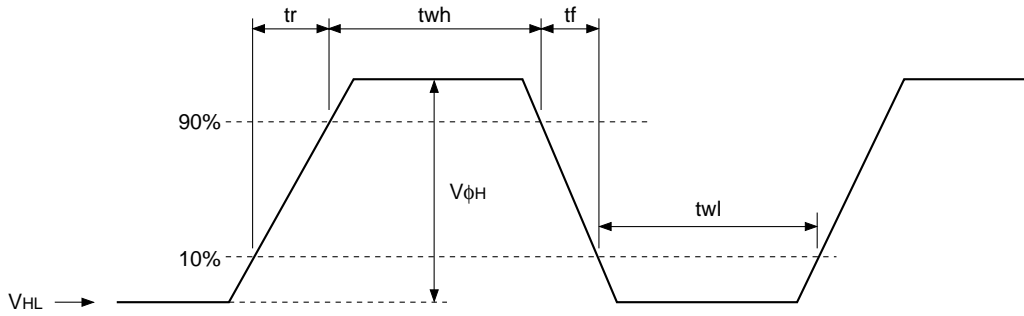

$$V_{VH} = (V_{VH1} + V_{VH2})/2$$

$$V_{VL} = (V_{VLL3} + V_{VLL4})/2$$

$$V_{\phi V} = V_{VHn} - V_{VLLn} \quad (n = 1 \text{ to } 4)$$

**(3) Horizontal transfer clock waveform**

**(4) Reset gate clock waveform**

$V_{RGLH}$  is the maximum value and  $V_{RGLL}$  is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG. In addition,  $V_{RGL}$  is the average value of  $V_{RGLH}$  and  $V_{RGLL}$ .

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2$$

Assuming  $V_{RGH}$  is the minimum value during the interval  $t_{wh}$ , then:

$$V_{\phi_{RG}} = V_{RGH} - V_{RGL}$$

Negative overshoot level during the falling edge of RG is  $V_{RGLm}$ .

**(5) Substrate clock waveform**

**Clock Switching Characteristics**

Item	Symbol	twh			twl			tr			tf			Unit	Remarks	
		Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.			
Readout clock	V <sub>T</sub>	2.3	2.5						0.5			0.5		μs	During readout	
Vertical transfer clock	V <sub>φ1</sub> , V <sub>φ2</sub> , V <sub>φ3</sub> , V <sub>φ4</sub>										15		250	ns	*1	
Horizontal transfer clock	During imaging	H <sub>φ1</sub>	26	28.5		26	28.5			6.5	9.5		6.5	9.5	ns	*2
		H <sub>φ2</sub>	26	28.5		26	28.5			6.5	9.5		6.5	9.5		
	During parallel-serial conversion	H <sub>φ1</sub>		5.38						0.01			0.01		μs	
		H <sub>φ2</sub>					5.38			0.01			0.01			
Reset gate clock	φ <sub>RG</sub>	11	13			51			3			3		ns		
Substrate clock	φ <sub>SUB</sub>	1.5	1.8							0.5			0.5	μs	During drain charge	

\*1 When vertical transfer clock driver CXD1267AN is used.

\*2 When V<sub>φH</sub> = 3.0V. tf ≥ tr – 2ns, and the cross-point voltage (V<sub>CR</sub>) for the H<sub>φ1</sub> rising side of the H<sub>φ1</sub> and H<sub>φ2</sub> waveforms must be at least V<sub>φH</sub>/2 [V].

Item	Symbol	two			Unit	Remarks
		Min.	Typ.	Max.		
Horizontal transfer clock	H <sub>φ1</sub> , H <sub>φ2</sub>	22	26		ns	*3

\*3 The overlap period for twh and twl of horizontal transfer clocks H<sub>φ1</sub> and H<sub>φ2</sub> is two.

Image Sensor Characteristics

Zone Definition of Video Signal Shading

## Image Sensor Characteristics Measurement Method

### ◎ Measurement conditions

- 1) In the following measurements, the device drive conditions are at the typical values of the bias and clock voltage conditions.
- 2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output, and the value measured at point [\*A] in the drive circuit example is used.

### ◎ Definition of standard imaging conditions

- 1) Standard imaging condition I:  
Use a pattern box (luminance: 706cd/m<sup>2</sup>, color temperature of 3200K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F8. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.
- 2) Standard imaging condition II:  
Indicate the state which removes an IR cut filter of standard imaging condition I.
- 3) Standard imaging condition III:  
Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.
- 4) Standard imaging condition IV:  
Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens (exit pupil distance –33mm) with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

#### 1. Sensitivity 1

Set to standard imaging condition I. After selecting the electronic shutter mode with a shutter speed of 1/250s, measure the signal output (Vs<sub>1</sub>) at the center of the screen and substitute the value into the following formula.

$$S1 = V_{S1} \times \frac{250}{60} \text{ [mV]}$$

#### 2. Sensitivity 2

Set to standard imaging condition II. After selecting the electronic shutter mode with a shutter speed of 1/1000s, measure the signal output (Vs<sub>2</sub>) at the center of the screen and substitute the value into the following formula.

$$S2 = V_{S2} \times \frac{1000}{60} \text{ [mV]}$$

#### 3. Saturation signal

Set to standard imaging condition III. After adjusting the luminous intensity to 10 times the intensity with the average value of the signal output, 200mV, measure the minimum value of the signal output.

4. Smear

Set to standard imaging condition III. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity to 500 times the intensity with average value of the signal output, 200mV. When the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value YSm [mV] of the signal output and substitute the value into the following formula.

$$S_m = 20 \times \log \left( \frac{V_{Sm}}{200} \times \frac{1}{500} \times \frac{1}{10} \right) \text{ [dB]} \text{ (1/10V method conversion value)}$$

5. Video signal shading

Set to standard imaging condition IV. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity so that the average value of the signal output is 200mV. Then measure the maximum (Vmax [mV]) and minimum (Vmin [mV]) values of the signal output and substitute the values into the following formula.

$$SH = (V_{max} - V_{min})/200 \times 100 \text{ [%]}$$

6. Dark signal

Measure the average value of the signal output (Vdt [mV]) with the device ambient temperature 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

7. Dark signal shading

After measuring 6, measure the maximum (Vdmax [mV]) and minimum (Vdmin [mV]) values of the dark signal output and substitute the values into the following formula.

$$\Delta V_{dt} = V_{dmax} - V_{dmin} \text{ [mV]}$$

8. Flicker

Set to standard imaging condition III. Adjust the luminous intensity so that the average value of the signal output is 200mV, and then measure the difference in the signal level between fields ( $\Delta V_f$  [mV]). Then substitute the value into the following formula.

$$F = (\Delta V_f/200) \times 100 \text{ [%]}$$

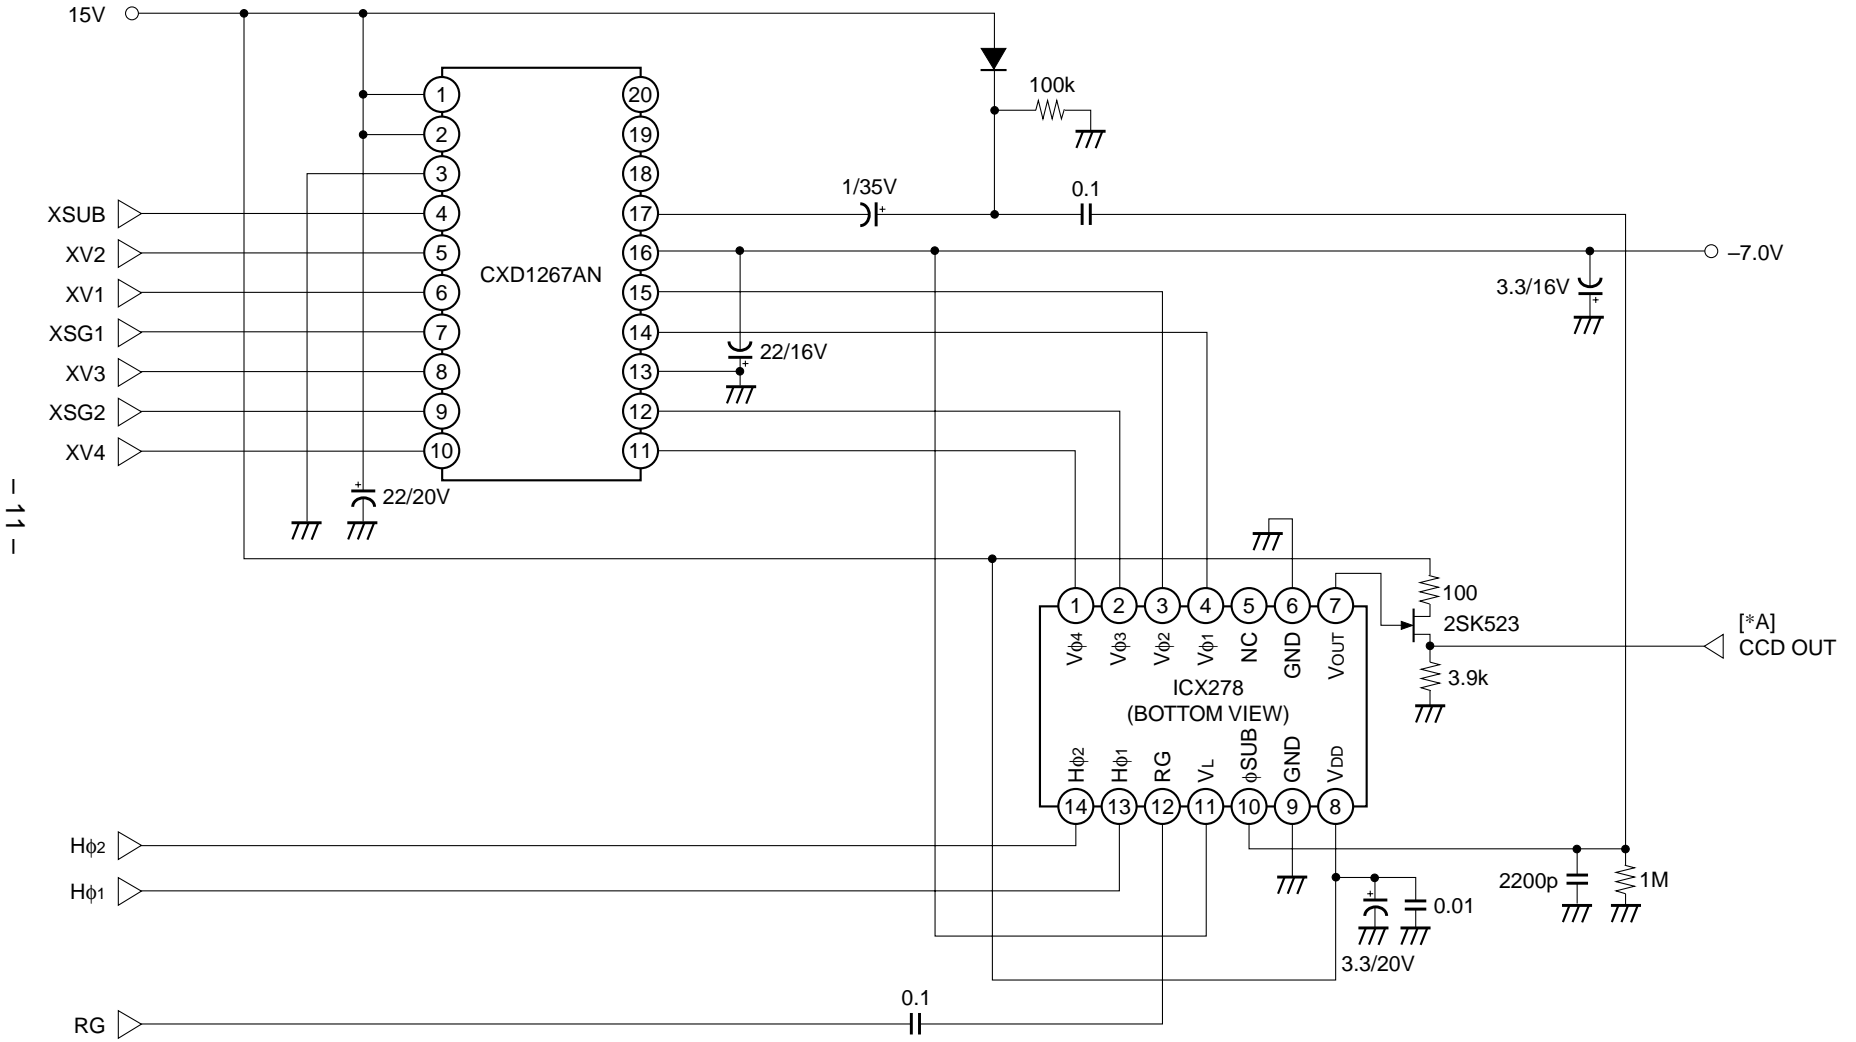

9. Lag

Adjust the signal output value generated by strobe light to 200mV. After setting the strobe light so that it strobes with the following timing, measure the residual signal (Vlag). Substitute the value into the following formula.

$$Lag = (V_{lag}/200) \times 100 \text{ [%]}$$

### Drive Timing Chart (Vertical Sync)

Drive Timing Chart (Horizontal Sync)

## Notes on Handling

### 1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- a) Either handle bare handed or use non-chargeable gloves, clothes or material.  
Also use conductive shoes.
- b) When handling directly use an earth band.
- c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- d) Ionized air is recommended for discharge when handling CCD image sensor.
- e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

### 2) Soldering

- a) Make sure the package temperature does not exceed 80°C.
- b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero cross On/Off type and connect it to ground.

### 3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operation as required, and use them.

- a) Perform all assembly operations in a clean room (class 1000 or less).
- b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)
- c) Clean with a cotton bud and ethyl alcohol if the grease stained. Be careful not to scratch the glass.
- d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

### 4) Installing (attaching)

- a) Remain within the following limits when applying a static load to the package. Do not apply any load more than 0.7mm inside the outer perimeter of the glass portion, and do not apply any load or impact to limited portions. (This may cause cracks in the package.)

- b) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.
  - c) The adhesive may cause the marking on the rear surface to disappear, especially in case the regulated voltage value is indicated on the rear surface. Therefore, the adhesive should not be applied to this area, and indicated values should be transferred to the other locations as a precaution.
  - d) The notch of the package is used for directional index, and that can not be used for reference of fixing. In addition, the cover glass and seal resin may overlap with the notch of the package.
  - e) If the lead bend repeatedly and the metal, etc., clash or rub against the package, the dust may be generated by the fragments of resin.
  - f) Acrylate anaerobic adhesives are generally used to attach CCD image sensors. In addition, cyano-acrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives. (reference)
- 5) Others
- a) Do not expose to strong light (sun rays) for long periods. For continuous using under cruel condition exceeding the normal using condition, consult our company.
  - b) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.
  - c) The brown stain may be seen on the bottom or side of the package. But this does not affect the CCD characteristics.
  - d) This CCD image sensor has sensitivity in the near infrared area. Its focus may not match in the same condition under visible light/near infrared light because of aberration. Incident light component of long wavelength which transmits the silicon substrate may have bad influence upon image.
  - e) This package has 2 kinds of internal structure. However, their package outline, optical size, and strength are the same.

The cross section of lead frame can be seen on the side of the package for structure A.

Package Outline

Unit: mm

14 pin DIP (400mil)

1. "A" is the center of the effective image area.
2. The two points "B" of the package are the horizontal reference. The point "B" of the package is the vertical reference.
3. The bottom "C" of the package, and the top of the cover glass "D" are the height reference.
4. The center of the effective image area relative to "B" and "B'" is (H, V) = (5.0, 5.0) ± 0.15mm.
5. The rotation angle of the effective image area relative to H and V is ± 1°.
6. The height from the bottom "C" to the effective image area is 1.41 ± 0.10mm. The height from the top of the cover glass "D" to the effective image area is 1.94 ± 0.15mm.
7. The tilt of the effective image area relative to the bottom "C" is less than 25µm. The tilt of the effective image area relative to the top "D" of the cover glass is less than 25µm.
8. The thickness of the cover glass is 0.75mm, and the refractive index is 1.5.
9. The notch of the package is used only for directional index, that must not be used for reference of fixing.

PACKAGE STRUCTURE

PACKAGE MATERIAL	Plastic
