

40V 4A QUAD POWER HALF BRIDGE

1 FEATURES

- MINIMUM INPUT OUTPUT PULSE WIDTH DISTORTION
- 200m Ω R_{dsON} COMPLEMENTARY DMOS OUTPUT STAGE
- CMOS COMPATIBLE LOGIC INPUTS
- THERMAL PROTECTION
- THERMAL WARNING OUTPUT
- UNDER VOLTAGE PROTECTION
- SHORT CIRCUIT PROTECTION

2 DESCRIPTION

STA506 is a monolithic quad half bridge stage in Multipower BCD Technology.

The device can be used as dual bridge or reconfigured, by connecting CONFIG pin to V_{dd} pin, as single bridge with double current capability, and as half bridge (Binary mode) with half current capability. The device is particularly designed

MULTIPOWER BCD TECHNOLOGY

PowerSO36

Table 1. Order Code

Part Number	Package
STA506	PowerSO36

to make the output stage of a stereo All-Digital High Efficiency (DDX™) amplifier capable to deliver 60 + 60W @ THD = 10% at V_{CC} 32V output power on 8 Ω load and 80W @ THD = 10% at V_{CC} 36V on 8 Ω load in single BTL configuration. In single BTL configuration is also capable to deliver a peak of 120W @THD = 10% at V_{CC} = 32V on 4 Ω load (t $\leq$ 1sec). The input pins have threshold proportional to V_L pin voltage.

Figure 1. APPLICATION CIRCUIT (Dual BTL)

Table 2. PIN FUNCTION

Pin n.	Pin Name	Description
1	GND-SUB	Substrate Ground
2 ; 3	OUT2B	Output Half Bridge 2B
4	V _{CC} 2B	Positive Supply
5	GND2B	Negative Supply
6	GND2A	Negative Supply
7	V _{CC} 2A	Positive Supply
8 ; 9	OUT2A	Output Half Bridge 2A
10 ; 11	OUT1B	Output Half Bridge 1B
12	V _{CC} 1B	Positive Supply
13	GND1B	Negative Supply
14	GND1A	Negative Supply
15	V _{CC} 1A	Positive Supply
16 ; 17	OUT1A	Output Half Bridge 1A
18	NC	Not Connected
19	GND-clean	Logical Ground
20	GND-Reg	Ground for Regulator V _{dd}
21 ; 22	V _{dd}	5V Regulator Referred to Ground
23	VL	Logic Reference Voltage
24	CONFIG	Configuration pin
25	PWRDN	Stand-by pin
26	TRI-STATE	Hi-Z pin
27	FAULT	Fault pin advisor
28	TH-WAR	Thermal warning advisor
29	IN1A	Input of Half Bridge 1A
30	IN1B	Input of Half Bridge 1B
31	IN2A	Input of Half Bridge 2A
32	IN2B	Input of Half Bridge 2B
33 ; 34	V _{SS}	5V Regulator Referred to +V _{CC}
35 ; 36	V _{CC} Sign	Signal Positive Supply

Table 3. FUNCTIONAL PIN STATUS

Pin name	Pin n.	Logical value	IC -STATUS
FAULT	27	0	Fault detected (Short circuit, or Thermal ..)
FAULT (*)	27	1	Normal Operation
TRI-STATE	26	0	All powers in Hi-Z state
TRI-STATE	26	1	Normal operation
PWRDN	25	0	Low absorption
PWRDN	25	1	Normal operation
THWAR	28	0	Temperature of the IC =130°C
THWAR(*)	28	1	Normal operation
CONFIG	24	0	Normal Operation
CONFIG(**)	24	1	OUT1A = OUT1B ; OUT2A=OUT2B (IF IN1A = IN1B; IN2A = IN2B)

(*) : The pin is open collector. To have the high logic value, it needs to be pulled up by a resistor.

(**): To put CONFIG = 1 means connect Pin 24 (CONFIG) to Pins 21, 22 (Vdd) to implement single BTL (mono mode) operation for high current.

Figure 2. PIN CONNECTION

Table 4. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CE}	DC Supply Voltage (Pin 4,7,12,15)	40	V
V_{max}	Maximum Voltage on pins 23 to 32 (logic reference)	5.5	V
P_{tot}	Power Dissipation ($T_{case} = 70^{\circ}C$)	50	W
T_{op}	Operating Temperature Range	0 to 70	$^{\circ}C$
T_{stg}, T_j	Storage and Junction Temperature	-40 to 150	$^{\circ}C$

Table 5. (*) RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{CC}	DC Supply Voltage	9.0		36.0	V
V_L	Input Logic Reference	2.7	3.3	5.0	v
T_{amb}	Ambient Temperature	0		70	$^{\circ}C$

(*) performances not guaranteed beyond recommended operating conditions

Table 6. THERMAL DATA

Symbol	Parameter	Min.	Typ.	Max.	Unit
T_{j-case}	Thermal Resistance Junction to Case (thermal pad)			1.5	$^{\circ}C/W$
T_{jSD}	Thermal shut-down junction temperature		150		$^{\circ}C$
T_{warn}	Thermal warning temperature		130		$^{\circ}C$
t_{hSD}	Thermal shut-down hysteresis		25		$^{\circ}C$

Table 7. ELECTRICAL CHARACTERISTICS: refer to circuit in Fig.1 ($V_L = 3.3V$; $V_{CC} = 32V$; $R_L = 8\Omega$; $f_{sw} = 384KHz$; $T_{amb} = 25^{\circ}C$ unless otherwise specified)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
R_{dsON}	Power Pchannel/Nchannel MOSFET R_{dsON}	$I_d=1A$		200	270	m Ω
I_{dss}	Power Pchannel/Nchannel leakage I_{dss}	$V_{CC}=35V$			50	μA
g_N	Power Pchannel R_{dsON} Matching	$I_d=1A$	95			%
g_P	Power Nchannel R_{dsON} Matching	$I_d=1A$	95			%
Dt_s	Low current Dead Time (static)	see test circuit no.1; see fig. 3		10	20	ns
Dt_d	High current Dead Time (dinamic)	$L=22\mu H$; $C = 470nF$; $R_L = 8\Omega$ $I_d=3.5A$; see fig. 5			50	ns
$t_{d\ ON}$	Turn-on delay time	Resistive load			100	ns
$t_{d\ OFF}$	Turn-off delay time	Resistive load			100	ns
t_r	Rise time	Resistive load; as fig.3			25	ns
t_f	Fall time	Resistive load; as fig. 3			25	ns
V_{CC}	Supply voltage operating voltage		9		36	V
V_{IN-H}	High level input voltage				$V_L/2 + 300mV$	V

TABLE 6. ELECTRICAL CHARACTERISTICS (continued)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V _{IN-L}	Low level input voltage		V _L /2 - 300mV			V
I _{IN-H}	Hi level Input current	Pin Voltage = V _L		1		μA
I _{IN-L}	Low level input current	Pin Voltage = 0.3V		1		μA
I _{PWRDN-H}	Hi level PWRDN pin input current	V _L = 3.3V		35		μA
V _{LOW}	Low logical state voltage V _{Low} (pin PWRDN, TRISTATE) (note 1)	V _L = 3.3V	0.8			V
V _{HIGH}	High logical state voltage V _{High} (pin PWRDN, TRISTATE) (note 1)	V _L = 3.3V			1.7	V
I _{VCC-PWRDN}	Supply CURRENT from Vcc in Power Down	PWRDN = 0			3	mA
I _{FAULT}	Output Current pins FAULT -TH-WARN when FAULT CONDITIONS	V _{pin} = 3.3V		1		mA
I _{VCC-hiz}	Supply Current from Vcc in Tri-state	V _{CC} = 30V; Tri-state = 0		22		mA
I _{VCC}	Supply Current from Vcc in operation both channel switching)	V _{CC} = 30V; Input Pulse width = 50% Duty; Switching Frequency = 384KHz; No LC filters;		50		mA
I _{VCC-q}	Isc (short circuit current limit) (note 2)		4	6	8	A
V _{OUT-SH}	Undervoltage protection threshold			7		V
V _{OV}	Output minimum pulse width	No Load	70		150	ns

Notes: 1. The following table explains the V_{LOW}, V_{HIGH} variation with V_L

Table 8.

V _L	V _{LOW} min	V _{HIGH} max	Unit
2.7	0.7	1.5	V
3.3	0.8	1.7	V
5	0.85	1.85	V

Note 2: See relevant Application Note AN1994

3 TECHNICAL INFO:

The STA506 is a dual channel H-Bridge that is able to deliver more than 60W per channel (@ THD=10%) of audio output power in high efficiency.

The STA506 converts both DDX and binary-controlled PWM signals into audio power at the load. It includes a logic interface, integrated bridge drivers, high efficiency MOSFET outputs and thermal and short circuit protection circuitry.

In DDX mode, two logic level signals per channel are used to control high-speed MOSFET switches to connect the speaker load to the input supply or to ground in a Bridge configuration, according to the damped ternary Modulation operation.

In Binary Mode operation, both Full Bridge and Half Bridge Modes are supported. The STA506 includes over-current and thermal protection as well as an under-voltage

Lockout with automatic recovery. A thermal warning status is also provided.

Figure 6. STA506 Block Diagram Full-Bridge DDX® or Binary Modes

Figure 7. STA506 Block Diagram Binary Half-Bridge Mode

3.1 Logic Interface and Decode:

The STA506 power outputs are controlled using one or two logic level timing signals. In order to provide a proper logic interface, the Vbias input must operate at the same voltage as the DDX control logic supply.

3.2 Protection Circuitry:

The STA506 includes protection circuitry for over-current and thermal overload conditions. A thermal warning pin (pin.28) is activated low (open drain MOSFET) when the IC temperature exceeds 130C, in advance of the thermal shutdown protection. When a fault condition is detected, an internal fault signal acts to immediately disable the output power MOSFETs, placing both H-Bridges in high impedance state. At the same time an open-drain MOSFET connected to the fault pin (pin.27) is switched on.

There are two possible modes subsequent to activating a fault:

- **1) SHUTDOWN mode:** with FAULT (pull-up resistor) and TRI-STATE pins independent, an activated fault will disable the device, signaling low at the FAULT output.
The device may subsequently be reset to normal operation by toggling the TRI-STATE pin from High to Low to High using an external logic signal.

- **2) AUTOMATIC recovery mode:** This is shown in the Application Circuit of fig.1.
The FAULT and TRI-STATE pins are shorted together and connected to a time constant circuit comprising R59 and C58.
An activated FAULT will force a reset on the TRI-STATE pin causing normal operation to resume following a delay determined by the time constant of the circuit.
If the fault condition is still present, the circuit operation will continue repeating until the fault condition is removed.
An increase in the time constant of the circuit will produce a longer recovery interval. Care must be taken in the overall system design as not to exceed the protection thresholds under normal operation.

3.3 Power Outputs:

The STA506 power and output pins are duplicated to provide a low impedance path for the device's bridged outputs.

All duplicate power, ground and output pins must be connected for proper operation.

The PWRDN or TRI-STATE pins should be used to set all MOSFETS to the Hi-Z state during power-up until the logic power supply, V_L , is settled.

3.4 Parallel Output / High Current Operation:

When using DDX Mode output, the STA506 outputs can be connected in parallel in order to increase the output current capability to a load.

In this configuration the STA506 can provide 80W into 8 ohm or up to 120W into 4ohm.

This mode of operation is enabled with the CONFIG pin (pin.24) connected to VREG1 and the inputs combined INLA=INLB, INRA=INRB and the outputs combined OUTLA=OTLB, OUTRA=OUTRB.

3.5 Additional Informations:

Output Filter: A passive 2nd-order passive filter is used on the STA506 power outputs to reconstruct an analog Audio Signal.

System performance can be significantly affected by the output filter design and choice of passive components. A filter design for 6ohm/8ohm loads is shown in the Typical Application circuit of fig.1. Figure 9 shows a filter design suitable for 4ohm loads.

Figure 10 shows a filter for ½ bridge mode, 4 ohm loads.

Power Dissipation & Heat Sink requirements: The power dissipated within the device will depend primarily on the supply voltage, load impedance and output modulation level.

The PowerSO36 package of the STA506 includes an exposed thermal slug on the top of the device to provide a direct thermal path from the IC to the heatsink.

Careful consideration must be given to the overall thermal design. See figure 8 for power derating versus Slug temperature using different heatsinks and considering the $R_{th-jc} = 1.5^{\circ}\text{C/W}$.

Figure 8. STA506 power derating curve

Figure 9. Typical Single BTL Configuration to obtain 120W @ THD 10%, $R_L = 4\Omega$, $V_{CC} = 32V$ (note 1))

Note: 1. "A PWM modulator as driver is needed . In particular, this result is performed using the STA30X+STA50X demo board". Peak Power for $t \leq 1\text{sec}$
