SCBS716C - MARCH 2000 - REVISED SEPTEMBER 2003

- Members of the Texas Instruments Widebus™ Family
- State-of-the-Art Advanced BiCMOS Technology (ABT) Design for 3.3-V Operation and Low Static-Power Dissipation
- Support Mixed-Mode Signal Operation (5-V Input and Output Voltages With 3.3-V V<sub>CC</sub>)
- Support Unregulated Battery Operation Down to 2.7 V
- Typical V<sub>OLP</sub> (Output Ground Bounce)
   <0.8 V at V<sub>CC</sub> = 3.3 V, T<sub>A</sub> = 25°C
- I<sub>off</sub> and Power-Up 3-State Support Hot Insertion
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
  - 2000-V Human-Body Model (A114-A)
  - 200-V Machine Model (A115-A)
  - 1000-V Charged-Device Model (C101)

### description/ordering information

The 'LVT16244B devices are 16-bit buffers and line drivers designed for low-voltage (3.3-V)  $V_{CC}$  operation, but with the capability to provide a TTL interface to a 5-V system environment. These devices can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. These devices provide true outputs and symmetrical active-low output-enable  $(\overline{OE})$  inputs.

<sup>†</sup> Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at www.ti.com/sc/package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Widebus is a trademark of Texas Instruments.

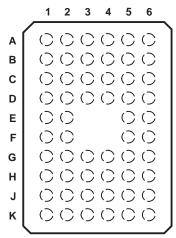

SCBS716C - MARCH 2000 - REVISED SEPTEMBER 2003

### description/ordering information (continued)

When  $V_{CC}$  is between 0 and 1.5-V, the devices are in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 1.5-V,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

These devices are fully specified for hot-insertion applications using  $I_{off}$  and power-up 3-state. The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the devices when they are powered down. The power-up 3-state circuitry places the outputs in the high-impedance state during power up and power down, which prevents driver conflict.

# absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V <sub>CC</sub> –  Input voltage range, V <sub>I</sub> (see Note 1)  Voltage range applied to any output in the high-impedance	
or power-off state, V <sub>O</sub> (see Note 1)	$-0.5\ V$ to $7\ V$
Voltage range applied to any output in the high state, V <sub>O</sub> (see Note 1)0.5 V to	$V_{CC} + 0.5 V$
Current into any output in the low state, IO: SN54LVT16244B	
SN74LVT16244B	128 mA
Current into any output in the high state, IO (see Note 2): SN54LVT16244B	48 mA
SN74LVT16244B	64 mA
Input clamp current, $I_{IK}$ ( $V_I < 0$ )	–50 mA
Output clamp current, I <sub>OK</sub> (V <sub>O</sub> < 0)	
Package thermal impedance, θ <sub>JA</sub> (see Note 3): DGG package	70°C/W
DGV package	58°C/W
DL package	63°C/W
GQL/ZQL package	42°C/W
Storage temperature range, T <sub>stq</sub>	

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
  - 2. This current flows only when the output is in the high state and  $V_O > V_{CC}$ .
  - 3. The package thermal impedance is calculated in accordance with JESD 51-7.

### recommended operating conditions (see Note 4)

			SN54LVT	16244B	SN74LVT	16244B	
			MIN	MAX	MIN	MAX	UNIT
Vcc	Supply voltage		2.7	3.6	2.7	3.6	V
VIH	High-level input voltage		2	2	2		V
V <sub>IL</sub>	Low-level input voltage			0.8		8.0	V
VI	Input voltage		ć	5.5		5.5	V
IOH	High-level output current		6	-24		-32	mA
lOL	Low-level output current		200	48		64	mA
Δt/Δν	Input transition rise or fall rate	Outputs enabled	0	10		10	ns/V
Δt/ΔV <sub>CC</sub>	Power-up ramp rate		200		200		μs/V
TA	Operating free-air temperature		-55	125	-40	85	°C

NOTE 4: All unused inputs of the device must at V<sub>CC</sub> or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, literature number SCBA004.

SCBS716C - MARCH 2000 - REVISED SEPTEMBER 2003

### PARAMETER MEASUREMENT INFORMATION

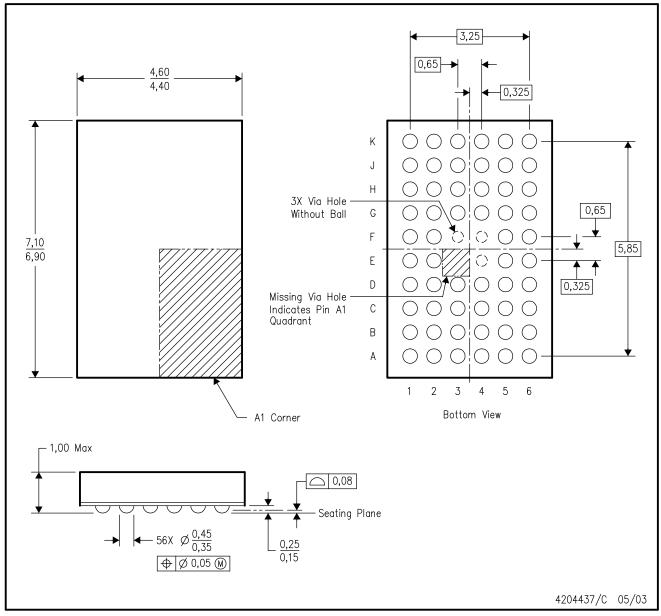

NOTES: A. C<sub>I</sub> includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR  $\leq$  10 MHz, Z<sub>O</sub> = 50  $\Omega$ ,  $t_f \leq$  2.5 ns,  $t_f \leq$  2.5 ns.
- D. The outputs are measured one at a time with one transition per measurement.
