

# 18-27 GHz 1W Power Amplifier

# TGA1135B-SCC

Chip Dimensions 2.641 mm x 1.480 mm

## Product Description

The TriQuint TGA1135B-SCC is a balanced two-stage HPA MMIC design using TriQuint's proven 0.25 um Power pHEMT process. The TGA1135B is designed to support a variety of millimeter wave applications including point-to-point digital radio and LMDS/LMCS.

The balanced configuration two stage design consists of a pair of 600um input devices driving a 4 x 600um output stage. Power combining is achieved with on-chip Lange couplers.

The TGA1135B-SCC provides 29 dBm nominal output power at 1dB compression across 18 - 27GHz. Typical small signal gain is 14 dB across the band. Input and output return loss is typically -15dB.

An on-chip power detector and reference diode may be used for power monitoring/control and bias control loops.

The TGA1135B-SCC requires minimum off-chip components. Each device is 100% DC and RF tested on-wafer to ensure performance compliance. The device is available in chip form.

## Key Features

- 0.25 um pHEMT Technology
- 14 dB Nominal Gain at 23GHz
- 29 dBm Nominal P1dB
- 37dBm OTOI typical
- Typical 15dB Input/Output RL
- Bias 6 - 7V @ 480 mA
- On-chip power detector diode

## Primary Applications

- Point-to-Point Radio
- Point-to-Multipoint Communications
- Ka Band Sat-Com

T <sub>M</sub>	MOUNTING TEMPERATURE (30 SECONDS)	320 °C	
T <sub>STG</sub>	STORAGE TEMPERATURE	-65 to 150 °C	

1/ Total current for all stages.

2/ These ratings apply to each individual FET.

3/ Junction operating temperature will directly affect the device median time to failure (T<sub>M</sub>). For maximum life, it is recommended that junction temperatures be maintained at the lowest possible levels.

4/ These ratings represent the maximum operable values for the device.

## Assembly Process Notes

Reflow process assembly notes:

- AuSn (80/20) solder with limited exposure to temperatures at or above 300°C
- alloy station or conveyor furnace with reducing atmosphere
- no fluxes should be utilized
- coefficient of thermal expansion matching is critical for long-term reliability
- storage in dry nitrogen atmosphere

Component placement and adhesive attachment assembly notes:

- vacuum pencils and/or vacuum collets preferred method of pick up
- avoidance of air bridges during placement
- force impact critical during auto placement
- organic attachment can be used in low-power applications
- curing should be done in a convection oven; proper exhaust is a safety concern
- microwave or radiant curing should not be used because of differential heating
- coefficient of thermal expansion matching is critical

Interconnect process assembly notes:

- thermosonic ball bonding is the preferred interconnect technique
- force, time, and ultrasonics are critical parameters
- aluminum wire should not be used
- discrete FET devices with small pad sizes should be bonded with 0.0007-inch wire
- maximum stage temperature: 200°C
