

SP3T High Power 2.6V CDMA Antenna Switch

Functional Block Diagram

Product Description

TriQuint's TQP4M3018 is a high power antenna switch in a single pole three throw (SP3T) configuration. The die utilizes TriQuint's PHEMT MMIC switch process to provide optimized cross-modulation performance for use in CDMA applications. PHEMT Switches are a very low DC current replacement for classic PIN diode based switches. This product is ideally suited to applications where the antenna of a CDMA handset is to be routed to the Cellular duplexer, the PCS duplexer and the GPS receiver input. The design is symmetric and broadband allowing the user to assign cellular, PCS and GPS to ports RF1, RF2 or RF3 as desired.

0	1	0	Off	On	Off
0	0	1	Off	Off	On

Pin Descriptions:

Pad Number	Pad Name	Description
1	V3	Control RF Port 3
2	RF3	RF Port 3
3	N/C	No Connection
4	N/C	No Connection
5	RF2	RF Port 2
6	V2	Control RF Port 2
7	N/C	No Connection
8	RF1	RF Port 1 Port
9	V1	Control RF Port 1
10	N/C	No Connection
11	ANT	ANTENNA
12	N/C	No Connection

Note 1: State 1 = +2.4V to +5.0V; State 0 = 0V to +0.2V
Note 2: Differential voltage from State 1 to State 0 must be a minimum of 2.4V
Note 3: DC grounding is not required. Control voltages applied to pins 1, 6 and 9 are differential, being 0v and 2.6V nominally.
Note 4: All pins including the package center paddle are n/c = no connection and not grounded as the preferred user configuration. RF performance figures are quoted with n/c. Grounding an n/c will not prevent the switch operation but may give a small degradation in RF performance.
