Description

The U6264B is a static RAM manufactured using a CMOS process technology with the following operating modes:

- Read - Standby
- Write - Data Retention

The memory array is based on a 6-transistor cell.

The circuit is activated by the rising edge of E2 (at E1 = L), or the falling edge of $\overline{E1}$ (at E2 = H). The address and control inputs open simultaneously. According to the information of \overline{W} and \overline{G} , the data inputs, or outputs, are active. In a Read cycle, the data outputs are activated by the falling edge of \overline{G} , afterwards the data word read will be available at the outputs DQ0 - DQ7. After the address change, the data outputs go High-Z until the new read information is available. The data outputs have no preferred state. If the memory is driven by CMOS levels in the active state, and if there is no change of the

address, data input and control signals \overline{W} or \overline{G} , the operating current (at $I_O = 0$ mA) drops to the value of the operating current in the Standby mode. The Read cycle is finished by the falling edge of E2 or \overline{W} , or by the rising edge of $\overline{E1}$, respectively.

Data retention is guaranteed down to 2 V. With the exception of E2, all inputs consist of NOR gates, so that no pull-up/pull-down resistors are required. This gate circuit allows to achieve low power standby requirements by activation with TTL-levels too.

If the circuit is inactivated by E2 = L, the standby current (TTL) drops to 150 μ A typ.

Characteristics

All voltages are referenced to $V_{SS} = 0$ V (ground).

All characteristics are valid in the power supply voltage range and in the operating temperature range specified.

Dynamic measurements are based on a rise and fall time of ≤ 5 ns, measured between 10 % and 90 % of V_I , as well as input levels of $V_{IL} = 0$ V and $V_{IH} = 3$ V. The timing reference level of all input and output signals is 1.5 V, with the exception of the t_{dis} -times, in which cases transition is measured ± 200 mV from steady-state voltage.
