

CDMA Evaluation Board For PLL Frequency Synthesizer

EVAL-ADF4112EB1

FEATURES

Self-Contained Board including Synthesizer and VCO,
Loop Filter for generating CDMA frequencies (824MHz
to 849MHz)

Designed for 3kHz Loop Bandwidth

Accompanying Software allows complete control of synthe-
sizer functions from PC

Battery Operated: Choice of 3V or 5V supplies

Typical Phase Noise Performance of -81dBc/Hz @ 300 Hz
offset

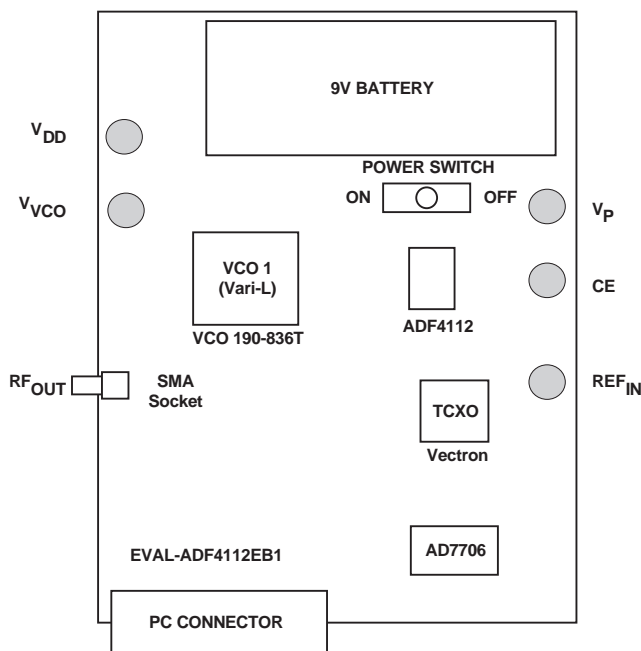

Typical Spurious Performance of better than -81dBc at
30kHz offset from carrier

GENERAL DESCRIPTION

This board is designed to allow the user to evaluate the performance of the ADF4112 Frequency Synthesizer for PLL's (Phase Locked Loops). The block diagram of the board is shown below. It contains the ADF4112 synthesizer, a pc connector, SMA connector for the reference input, power supplies and RF output. There is also a loop filter (3kHz bandwidth) and a VCO on board. A cable is included with the board to connect to a pc printer port.

The package also contains windows software to allow easy programming of the synthesizer.

The evaluation board comes with a cable for connecting to the printer port of a PC. The silk screen and cable diagram for the evaluation board are shown below. The board schematic is shown on pages 3 and 4.

All components necessary for LO generation are on-board. The 13MHz TCXO from Vectron provides the necessary Reference Input. The PLL is made up of the ADF4112, passive loop filter (20kHz bandwidth) and the VCO 190-836T from Vari-L. The output is available at RFOUT through a standard SMA connector. If the user wishes they may use their own power supplies and reference input. In this case, they need to insert SMA connectors to as shown on the silkscreen and block diagram.

The AD7706 A/D converter is used to monitor the power supply voltage and current consumption of the ADF4112. This helps the user pick the optimum synthesizer settings for power consumption and also provides an alert if the battery voltage is too low to sustain the required 3V or 5V for the board supply.

Loop component values shown in the circuit diagram are for 836MHz RF output, 5mA CP current, VCO190-836T, 30kHz channel spacing and 3kHz loop bandwidth.

Software Description

The evaluation board software is contained on a CD-ROM which comes in the package. To load the software the user should click on "setup.exe", then the install wizard installs the software. Follow the on-screen directions. The software will be installed in a default directory called "C:/Program Files/Analog Devices". To run the software, simply go to the Start Menu and choose Program/ADF4XXX/ADF4XXX_rev0. This will open the software for the evaluation board. The user will be asked to choose which device is being evaluated. Click on the ADF4112 button. Hit OK. The window shown below will now appear.

In this panel, click on the "Eval Board" button. Choose ADF4112EB1 from the list on offer. Hit OK. The synthesizer will now be programmed with the correct settings for a CDMA system working at 836MHz. 30kHz PFD frequency is set up, 32/33 prescaler is chosen and charge pump current of 5mA is programmed.

If the user wishes to change any of the settings then place the cursor over the desired parameter (RF VCO Output Fre-

quency, for example) and click once. This brings up a screen where it is possible to either type in a new value of output frequency or else increment and decrement by the channel spacing.

The software also allows monitoring of the device supply voltage, supply current and the charge pump voltage. Simply hit the "Update Voltage and Current Display" button to get an up-to-date reading.
