

2, 4, and 8-Channel Low Capacitance ESD Protection Arrays

Features

- 2, 4, and 8 channels of ESD protection
- Provides ESD protection to IEC61000-4-2
 - 8kV contact discharge
 - 15kV air discharge
- Low loading capacitance of 2.0pF max.
- Low clamping voltage
- Channel I/O to I/O capacitance 1.5pF typical
- Zener diode protects supply rail and eliminates the need for external by-pass capacitors
- Each I/O pin can withstand over 1000 ESD strikes
- Available in SOT, and MSOP packages
- Lead-free version available

Applications

- DVI ports, HDMI ports in notebooks, set top boxes, digital TVs, LCD displays
- Serial ATA ports in desktop PCs and hard disk drives
- PCI Express ports
- General purpose high-speed data line ESD protection

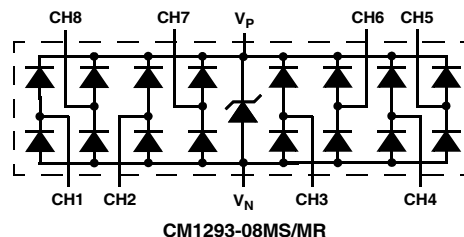

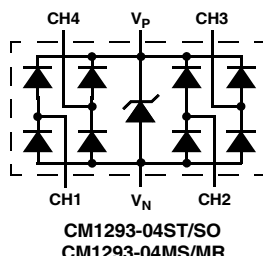

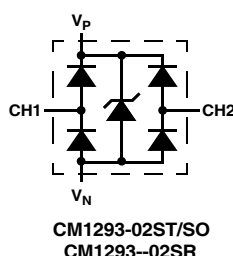

Product Description

The CM1293 family of diode arrays has been designed to provide ESD protection for electronic components or sub-systems requiring minimal capacitive loading. These devices are ideal for protecting systems with high data and clock rates or for circuits requiring low capacitive loading. Each ESD channel consists of a pair of diodes in series which steer the positive or negative ESD current pulse to either the positive (V_P) or negative (V_N) supply rail. A Zener diode is embedded between V_P and V_N , offering two advantages. First, it protects the V_{CC} rail against ESD strikes, and second, it eliminates the need for a bypass capacitor that would otherwise be needed for absorbing positive ESD strikes to ground. The CM1293 will protect against ESD pulses up to (± 15 kV air, ± 8 kV contact discharge) per the IEC 61000-4-2 Level 4 standard.

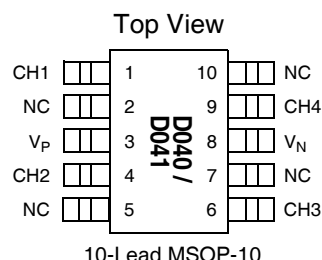

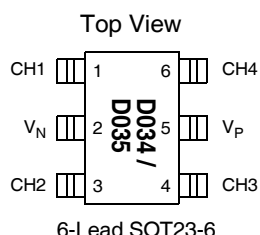

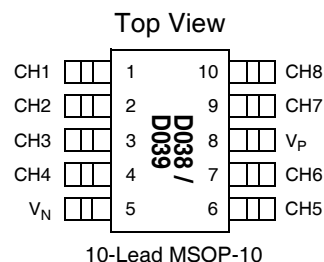

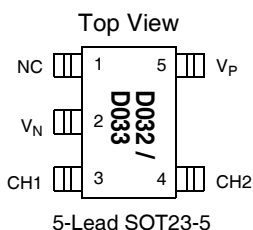

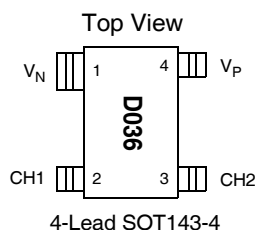

This device is particularly well-suited for protecting systems using high-speed ports such as USB2.0, IEEE1394 (Firewire[®], iLink[™]), Serial ATA, DVI, HDMI and corresponding ports in removable storage, digital camcorders, DVD-RW drives and other applications where extremely low loading capacitance with ESD protection are required in a small package footprint.

The CM1293 family of devices is available with optional lead-free finishing.

PIN DESCRIPTIONS

2-CHANNEL, 4-LEAD SOT143-4 PACKAGE

PIN	NAME	TYPE	PIN
1	V _N	GND	1
2	CH1	I/O	2
3	CH2	I/O	3
4	V _P	PWR	4

2-CHANNEL, 5-LEAD SOT23-5 PACKAGE

PIN	NAME	TYPE	DESCRIPTION
1	NC		No connect
2	V _N	GND	Negative voltage supply rail
3	CH1	I/O	ESD Channel
4	CH2	I/O	ESD Channel
5	V _P	PWR	Positive voltage supply rail

4-CHANNEL, 6-LEAD SOT23-6 PACKAGE

PIN	NAME	TYPE	DESCRIPTION
1	CH1	I/O	ESD Channel
2	V _N	GND	Negative voltage supply rail
3	CH2	I/O	ESD Channel
4	CH3	I/O	ESD Channel
5	V _P	PWR	Positive voltage supply rail
6	CH4	I/O	ESD Channel
5	V _P	PWR	Positive voltage supply rail
6	CH4	I/O	ESD Channel

4-CHANNEL, 10-LEAD MSOP-10 PACKAGE

PIN	NAME	TYPE	DESCRIPTION
1	CH1	I/O	ESD Channel
2	NC		No connect
3	V _P	PWR	Positive voltage supply rail
4	CH2	I/O	ESD Channel
5	NC		No connect
6	CH3	I/O	ESD Channel
7	NC		No connect
8	V _N	GND	Negative voltage supply rail
9	CH4	I/O	ESD Channel
10	NC		No connect

8-CHANNEL, 10-LEAD MSOP-10 PACKAGE

PIN	NAME	TYPE	DESCRIPTION
1	CH1	I/O	ESD Channel
2	CH2	I/O	ESD Channel
3	CH3	I/O	ESD Channel
4	CH4	I/O	ESD Channel
5	V _N	PWR	Positive voltage supply rail
6	CH5	I/O	ESD Channel
7	CH6	I/O	ESD Channel
8	V _N	GND	Negative voltage supply rail
9	CH7	I/O	ESD Channel
10	CH8	I/O	ESD Channel

Application Information

Design Considerations

In order to realize the maximum protection against ESD pulses, care must be taken in the PCB layout to minimize parasitic series inductances on the Supply/Ground rails as well as the signal trace segment between the signal input (typically a connector) and the ESD protection device. Refer to Figure 3, which illustrates an example of a positive ESD pulse striking an input channel. The parasitic series inductance back to the power supply is represented by L_1 and L_2 . The voltage V_{CL} on the line being protected is:

$$V_{CL} = \text{Fwd voltage drop of } D_1 + V_{\text{SUPPLY}} + L_1 \times d(I_{\text{ESD}}) / dt + L_2 \times d(I_{\text{ESD}}) / dt$$

where I_{ESD} is the ESD current pulse, and V_{SUPPLY} is the positive supply voltage.

An ESD current pulse can rise from zero to its peak value in a very short time. As an example, a level 4 contact discharge per the IEC61000-4-2 standard results in a current pulse that rises from zero to 30 Amps in 1ns. Here $d(I_{\text{ESD}})/dt$ can be approximated by $\Delta I_{\text{ESD}}/\Delta t$, or $30/(1 \times 10^{-9})$. So just 10nH of series inductance (L_1 and L_2 combined) will lead to a 300V increment in V_{CL} !

Similarly for negative ESD pulses, parasitic series inductance from the V_N pin to the ground rail will lead to drastically increased negative voltage on the line being protected.

The CM1293 has an integrated Zener diode between V_P and V_N . This greatly reduces the effect of supply rail

inductance L_2 on V_{CL} by clamping V_P at the breakdown voltage of the Zener diode. However, for the lowest possible V_{CL} , especially when V_P is biased at a voltage significantly below the Zener breakdown voltage, it is recommended that a 0.22μF ceramic chip capacitor be connected between V_P and the ground plane.

As a general rule, the ESD Protection Array should be located as close as possible to the point of entry of expected electrostatic discharges. The power supply bypass capacitor mentioned above should be as close to the V_P pin of the Protection Array as possible, with minimum PCB trace lengths to the power supply, ground planes and between the signal input and the ESD device to minimize stray series inductance.
