

CLM2950 / CLM2951

FEATURES

- 5V, 3.3V, and 3.0V Versions at 150mA Output
- Very Low Quiescent Current
- Low Dropout Voltage
- Extremely Tight Load and Line Regulation
- Very Low Temperature Coefficient
- Needs Only 1 μ F for Stability
- Current and Thermal Limiting
- Unregulated DC Input can Withstand -20V Reverse Battery and +60V Positive Transients
- Similar Replacement for LP2950/LP2951 Sockets

CLM2951 Versions Only

- Error Flag Warns of Output Dropout
- Logic-Controlled Electronic Shutdown
- Output Programmable from 1.24 to 29V

APPLICATIONS

- Battery Powered Systems
- Cordless Telephones
- Radio Control Systems
- Portable / Palm Top / Notebook Computers
- Portable Consumer Equipment
- Portable Instrumentation
- Avionics
- Automotive Electronics
- SMPS Post-Regulator
- Voltage Reference

PRODUCT DESCRIPTION

Calogic's CLM2950 and CLM2951 are low power voltage regulators. These devices are an excellent choice for use in battery-powered applications such as cordless telephones, radio control systems, and portable computers. The CLM2950 and CLM2951 features very low quiescent current and very low dropout voltage (Typ. 50mV at light load and 380mV at 100mA). This includes a tight initial tolerance of 0.5% typ., extremely good load and line regulation of 0.05% typ. and very low output temperature coefficient, making the CLM2950/CLM2951 useful as a low-power voltage reference. Other key additional features of this device includes higher output current (150mA), positive transient protection up to 60V (Load dump), and the ability to survive an unregulated input voltage transient of -20V below ground (reverse battery).

The error flag output feature is used as power-on reset for warning of a low output voltage, due to falling voltage input of batteries. Another feature is the logic-compatible shutdown input which enables the regulator to be switched on and off. The CLM2950 is offered in a 3-pin TO-92 package compatible with other 5 volt regulators. The CLM2951 is also available in 8-pin plastic and SO-8.

The regulator output voltage may be pin-strapped for a 5V, 3.3V and 3.0 volts or programmed from 1.24 volt to 29 volts with an external pair of resistors.

ORDERING INFORMATION

PART	PACKAGE	TEMPERATURE RANGE
CLM2950ACN-X	TO-92 (3-Pin)	IND.
CLM2950CN-X	TO-92 (3-Pin)	IND.
CLM2951ACP-X	Plastic DIP (8-Pin)	IND.
CLM2951CP-X	Plastic DIP (8-Pin)	IND.
CLM2951ACS-X	Plastic SOIC (8-Pin)	IND.
CLM2951CS-X	Plastic SOIC (8-Pin)	IND.

X = 3.0V, 3.3V or 5.0V

PIN CONNECTIONS

8-PIN SURFACE MOUNT

TO-92

ABSOLUTE MAXIMUM RATINGS

Power Dissipation Internally Limited
 Lead Temp. (Soldering, 5 Seconds) 260°C
 Storage Temperature Range -65 to +150°C
 Operating Junction Temperature Range
 CLM2951 -55 to +150°C
 CLM2950AC/CLM2950C
 CLM2951AC/CLM2951C -40 to +125°C

Input Supply Voltage -20 to +60V
 Feedback Input Voltage -1.5 to +30V
 Shutdown Input Voltage -0.3 to +30V
 Error Comparator Output -0.3 to +30V
 ESD Rating 2KV Min

ELECTRICAL CHARACTERISTICS: $V_S = 15V$, $T_A = 25^\circ C$, unless otherwise specified.

Note 1: Output or reference voltage temperature coefficients defined as the worst case voltage change divided by the total temperature range.

Note 2: Unless otherwise specified all limits guaranteed for T_J = 25°C, V_{IN} = 6V, I_L = 100μA and C_L = 1μF. Additional conditions for the 8-pin versions are feedback tied to 5V tap and output tied to output Sense (V_{OUT} = 5V) and V_{SHUTDOWN} ≤ 0.8V.

Note 3: Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specification for thermal regulation.

Note 4: Line regulation for the CLM2951 is tested at 150°C for I_L = 1mA. For I_L = 100μA and T_J = 125°C, line regulation is guaranteed by design to 0.2%. See typical performance characteristics for line regulation versus temperature and load current.

Note 5: Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below its nominal value measured at 1V differential at very low values of programmed output voltage, the minimum input supply voltage of 2V (2.3V over temperature) must be taken into account.

Note 6: V_{REF} ≤ V_{OUT} ≤ (V_{IN} - 1V), 2.3 ≤ V_{IN} ≤ 30V, 100μA ≤ I_L ≤ 150mA, T_J ≤ T_{JMAX}.

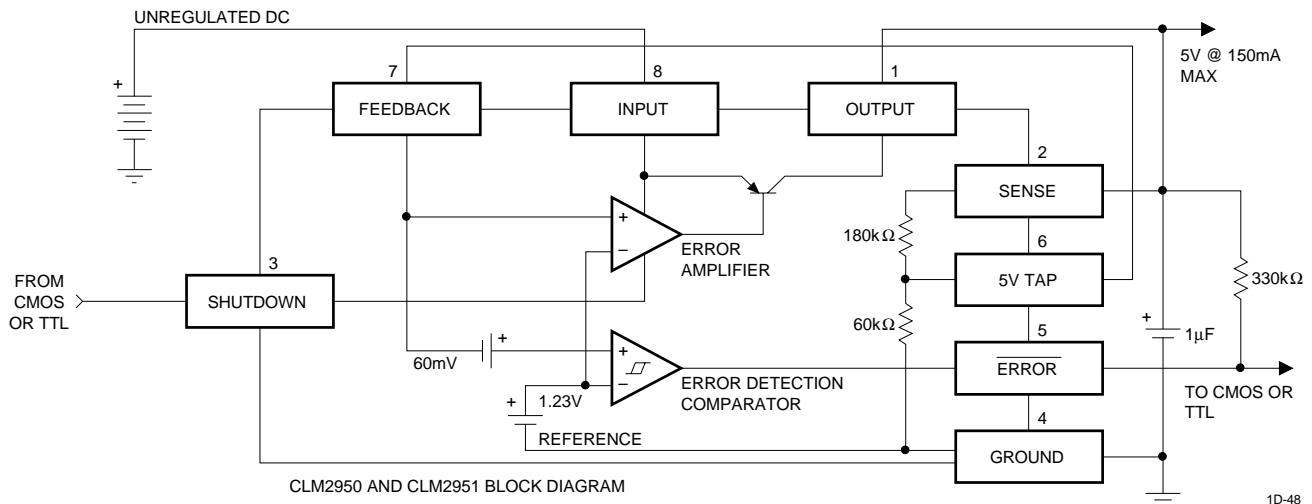

Note 7: Output or reference voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

Note 8: Comparator thresholds are expressed in terms of a voltage differential at the feedback terminal below the nominal reference voltage measured at 6V input. To express these thresholds in terms of output voltage change, multiply by the error amplifier gain = V_{OUT}/V_{REF} = (R1+R2)/R2. For example, at a programmed output voltage of 5V, the error output is guaranteed to go low when the output drops by 95mV x 5V/1.235 = 384mV. Thresholds remain constant as a percent of V_{OUT} as V_{OUT} is varied, with the dropout warning occurring at typically 5% below nominal, 7.5% guaranteed.

Note 9: V_{SHUTDOWN} ≥ 2V, V_{IN} ≤ 30V, V_{OUT} = 0, Feedback pin tied to 5V Tap.

Note 10: All typical values are not guaranteed.

BLOCK DIAGRAM

APPLICATION HINTS**EXTERNAL CAPACITORS**

- The stability of the CLM2950/CLM2951 requires a 1.0 μ F or greater capacitor between output and ground. Oscillation could occur without this capacitor. Most types of tantalum or aluminum electrolytic works fine here. For operations below -25°C a solid tantalum is recommended since the many aluminum types have electrolytes that freeze at about -30°C. The ESR of about 5 Ω or less and resonant frequency about 500kHz are the most important parameters in the value of the capacitor. The capacitors value can be increased without limit.
- At lower values of output current, less output capacitance is required for stability. For currents below 10mA the value of the capacitor can be reduced to 0.5 μ F and 0.15 μ F for 1mA. More output capacitance is needed for the 8-pin version at voltages below 5V since it runs the error amplifier at lower gain.
- At worst case 5 μ F or greater must be used for the condition of 150mA load at 1.23V output.
- The CLM2950, unlike other low dropout regulators, will remain stable and in regulation with no load in addition to the internal voltage divider. The feature is especially important in applications like CMOS RAM keep-alive circuits. When setting the output voltage of the CLM2951 version with external resistors, a minimum load of 1 μ A is recommended.
- If there is more than 10 inches of wire between the input and the AC filter capacitor or if a battery is used as the input then a 1 μ A tantalum or aluminum electrolytic capacitor should be placed from the input to the ground.
- Instability can occur if there is a stray capacitance to the CLM2951 feedback terminal (pin 7). This could cause more problems when using a higher value of external resistors to set the output voltage. This problem can be fixed by adding a 100pF capacitor between output and feedback and increasing the output capacitor to at least 3.3 μ F.

ERROR DETECTION COMPARATOR OUTPUT

The Comparator produces a logic low output whenever the CLM2951 output falls out of regulation by more than around 5%. This is around 60mV offset divided by the 1.235 reference voltage. This trip level remains 5% below normal regardless of the programmed output voltage of the regulator. Figure 1 shows the timing diagram depicting the ERROR signal and the regulator output voltage as the CLM2951 input is ramped up and down. The ERROR signal becomes low at around 1.3V input, and goes high around 5V input (input voltage at which $V_{OUT} = 4.75$). Since the CLM2951's dropout voltage is load dependent, the input voltage trip point (around 5V) will vary with the load current. The output voltage trip point (approx. 4.75V) does not vary with load.

The error comparator has an open-collector output which requires an external pull-up resistor. Depending on the system requirements the resistor may be returned to 5V output or other supply voltage. In determining the value of this resistor, note that the output is rated to sink 400 μ A, this value adds to battery drain in a low battery condition. Suggested values range from 100K to 1M Ω . If the output is unused this resistor is not required.

PROGRAMMING THE OUTPUT VOLTAGE OF CLM2951

The CLM2951 may be pin-strapped for 5V using its internal voltage divider by tying Pin 1 (output) to Pin 2 (sense) and Pin 7 (feedback) to Pin 6 (5V Tap). Also, it may be programmed for any output voltage between its 1.235V reference and its 30V maximum rating. As seen in Figure 2, an external pair of resistors is required.

Refer to the below equation for the programming of the output voltage:

$$V_{OUT} = V_{REF} \times (1 + R_1/R_2) + I_{FB}R_1$$

The V_{REF} is 1.235 and I_{FB} is the feedback bias current, nominally -20nA. The minimum recommended load current of 1 μ A forces an upper limit of 1.2M Ω on value of R_2 . If no load is presented the I_{FB} produces an error of typically 2% in V_{OUT} which may be eliminated at room temperature by trimming R_1 . To improve the accuracy choose the value of $R_2 = 100k$ this reduces the error by 0.17% and increases the resistor program current by 12 μ A. Since the CLM2951 typically draws 60 μ A at no load with Pin 2 open-circuited this is a small price to pay.

REDUCING OUTPUT NOISE

It may be an advantage to reduce the AC noise present at the output. One way is to reduce the regulator bandwidth by increasing the size of the output capacitor. This is the only way that noise can be reduced on CLM2950 but is relatively inefficient, as increasing the capacitor from 1 μ F to 220 μ F only decreases the noise from 430 μ V to 160 μ Vrms for a 100kHz bandwidth at 5V output.

Noise could also be reduced fourfold by a bypass capacitor across R_1 , since it reduces the high frequency gain from 4 to unity.

$$C_{BYPASS} \cong 1/2\pi R_1 \times 200Hz$$

or choose 0.01 μ F. When doing this, the output capacitor must be increased to 3.3 μ F to maintain stability. These changes reduce the output noise from 430 μ V to 100 μ Vrms for a 100kHz bandwidth at 5V output. With the bypass capacitor added, noise no longer scales with output voltage so that improvements are more dramatic at higher voltages.

WIDE INPUT VOLTAGE RANGE CURRENT LIMITER

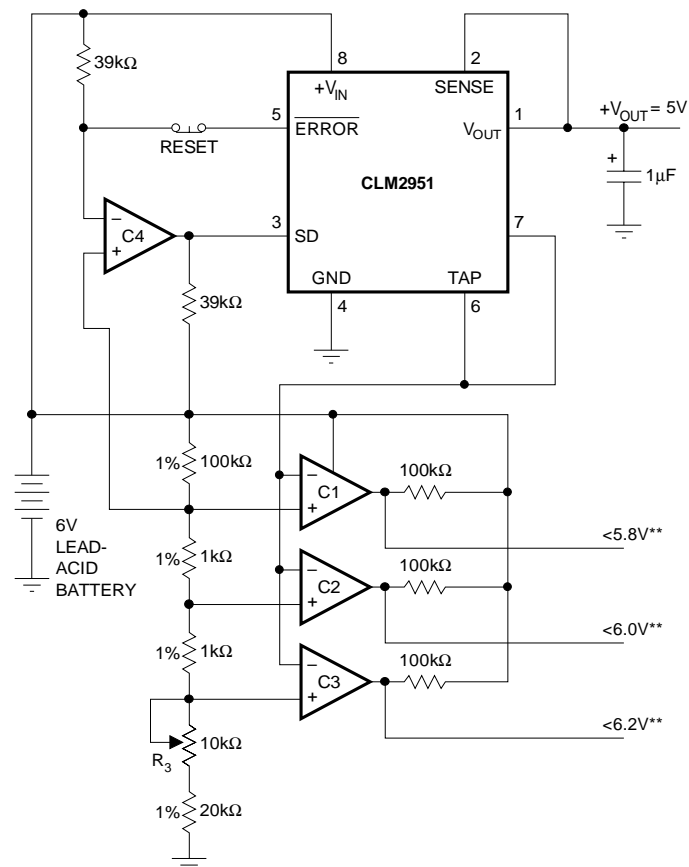

The diagram illustrates a Low Battery Disconnect circuit. It begins with a 6V SEALED LEAD-ACID BATTERY SOURCE. A 120KΩ resistor is connected to the positive terminal. The other end of this resistor is connected to the FB pin of a CLM385. The CLM385's other pins are connected to a 1.5KΩ resistor (to the positive terminal), an IN457 diode (cathode to positive terminal, anode to CLM385), and a 400KΩ resistor (to ground). A 100KΩ resistor is connected between the CLM385 and the base of a transistor. The transistor's emitter is grounded, and its collector is connected to the SD pin of a CLM2951. The CLM2951's +VIN pin is connected to the positive terminal, and its GND pin is grounded. The VOUT pin of the CLM2951 is connected to the MAIN V- line through a diode. The SENSE pin of the CLM2951 is connected to the positive terminal through a diode and to ground through a 1μF capacitor. The MEMORY V+ line is connected to the positive terminal through a 20KΩ resistor and to ground through an NI-CAD BACKUP BATTERY.
