

**CC1050****Single Chip Very Low Power RF Transmitter****Applications**

- *Very low power UHF wireless data transmitters*
- *315 / 433 / 868 and 915 MHz ISM/SRD band systems*
- *RKE – Remote Keyless Entry*
- *Home automation*
- *Wireless alarm and security systems*
- *AMR – Automatic Meter Reading*
- *Low power telemetry*
- *Toys*

**Product Description**

**CC1050** is a true single-chip UHF transmitter designed for very low power and very low voltage wireless applications. The circuit is mainly intended for the ISM (Industrial, Scientific and Medical) and SRD (Short Range Device) frequency bands at 315, 433, 868 and 915 MHz, but can easily be programmed for operation at other frequencies in the 300-1000 MHz range.

The main operating parameters of **CC1050** can be programmed via an easy-to-interface serial bus, thus making **CC1050** a very flexible and easy to use transmitter. In a typical system **CC1050** will be used together with a microcontroller and a few external passive components.

**CC1050** is based on Chipcon's SmartRF® technology in 0.35 µm CMOS.

**Features**

- True single chip UHF RF transmitter
- Very low current consumption
- Frequency range 300 – 1000 MHz
- Programmable output power –20 to 12 dBm
- Small size (TSSOP-24 package)
- Low supply voltage (2.1 V to 3.6 V)
- Very few external components required
- Single-ended antenna connection
- FSK data rate up to 76.8 kBaud
- Complies with EN 300 220 and FCC CFR47 part 15
- FSK modulation spectrum shaping
- Programmable frequency in 250 Hz steps makes crystal temperature drift compensation possible without TCXO
- Suitable for frequency hopping protocols
- Development Kit available
- Easy-to-use software for generating the **CC1050** configuration data

This document contains information on a pre-production product. Specifications and information herein are subject to change without notice.

## Pin Assignment

Pin no.	Pin name	Pin type	Description
1	AVDD	Power (A)	Power supply (3 V) for analog modules (PA)
2	AGND	Ground (A)	Ground connection (0 V) for analog modules (PA)
3	AGND	Ground (A)	Ground connection (0 V) for analog modules (PA)
4	AGND	Ground (A)	Ground connection (0 V) for analog modules (VCO and prescaler)
5	L1	Analog input	Connection no 1 for external VCO tank inductor
6	L2	Analog input	Connection no 2 for external VCO tank inductor
7	AVDD	Power (A)	Power supply (3 V) for analog modules (VCO and prescaler)
8	CHP_OUT	Analog output	Charge pump current output when external loop filter is used The pin can also be used as PLL Lock indicator. Output is high when PLL is in lock.
9	R_BIAS	Analog output	Connection for external precision bias resistor (82 kΩ, ± 1%)
10	AGND	Ground (A)	Ground connection (0 V) for analog modules (backplane)
11	AVDD	Power (A)	Power supply (3 V) for analog modules (general)
12	AGND	Ground (A)	Ground connection (0 V) for analog modules (general)
13	XOSC_Q2	Analog output	Crystal, pin 2
14	XOSC_Q1	Analog input	Crystal, pin 1, or external clock input
15	AGND	Ground (A)	Ground connection (0 V) for analog modules (guard)
16	DGND	Ground (D)	Ground connection (0 V) for digital modules (substrate)
17	DVDD	Power (D)	Power supply (3 V) for digital modules
18	DGND	Ground (D)	Ground connection (0 V) for digital modules
19	DI	Digital input	Data input in transmit mode
20	DCLK	Digital output	Clock for data in transmit mode
21	PCLK	Digital input	Programming clock for 3-wire bus
22	PDATA	Digital input/output	Programming data for 3-wire bus. Programming data input for write operation, programming data output for read operation
23	PALE	Digital input	Programming address latch enable for 3-wire bus
24	RF_OUT	RF output	RF signal output to antenna

A=Analog, D=Digital

(Top View)

## Absolute Maximum Ratings

Parameter	Min.	Max.	Units	Condition
Supply voltage, VDD	-0.3	5.0	V	
Voltage on any pin	-0.3	VDD+0.3, max 5.0	V	
Input RF level		10	dBm	
Storage temperature range	-50	150	°C	
Operating ambient temperature range	-40	85	°C	
Lead temperature		260	°C	T = 10 s

Under no circumstances the absolute maximum ratings given above should be violated. Stress exceeding one or more of

the limiting values may cause permanent damage to the device.

**Caution!** ESD sensitive device.  
Precaution should be used when handling the device in order to prevent permanent damage.

## Electrical Specifications

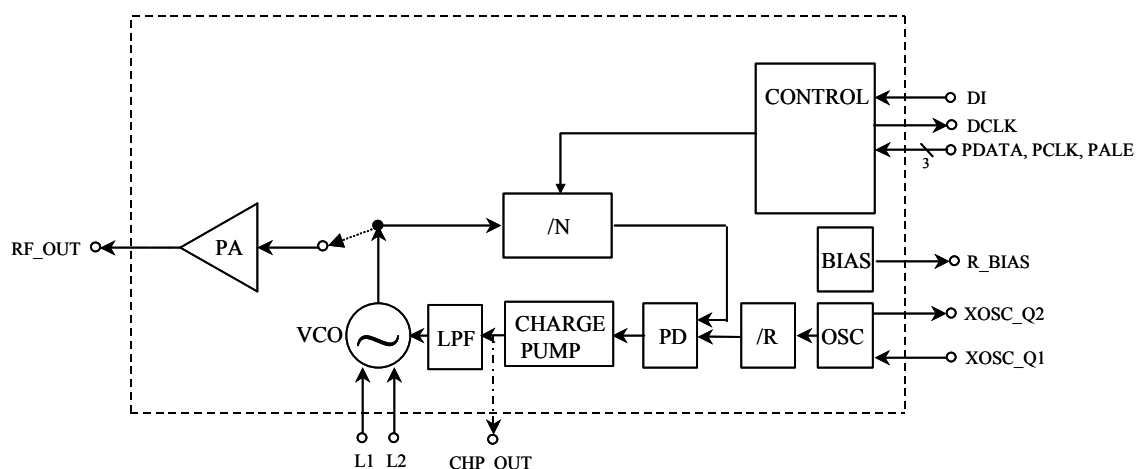

T<sub>c</sub> = 25°C, VDD = 3.0 V if nothing else stated

Parameter	Min.	Typ.	Max.	Unit	Condition / Note
<b>Overall</b>					
RF Frequency Range	300		1000	MHz	Programmable in steps of 250 Hz
<b>Transmit Section</b>					
Transmit data rate	0.6		76.8	kBaud	NRZ or Manchester encoding. 76.8 kBaud equals 76.8 kbit/s using NRZ coding. See page 13.
Binary FSK frequency separation	0		65	kHz	The frequency corresponding to the digital "0" is denoted $f_0$ , while $f_1$ corresponds to a digital "1". The frequency separation is $f_1 - f_0$ . The RF carrier frequency, $f_c$ , is then given by $f_c = (f_0 + f_1)/2$ . (The frequency deviation is given by $f_d = \pm(f_1 - f_0)/2$ ) The frequency separation is programmable in 250 Hz steps. 65 kHz is the minimum guaranteed separation at 1 MHz reference frequency. Larger separations can be achieved at higher reference frequencies.
Output power 433 MHz 868 MHz	-20 -20		12 8	dBm	Delivered to 50 $\Omega$ load. The output power is programmable.
RF output impedance 433/868 MHz		110 / 70		$\Omega$	Transmit mode. For matching details see p.22.
Spurious emission			-36	dBm	Complies with EN 300 220

Parameter	Min.	Typ.	Max.	Unit	Condition / Note
Harmonics		-20		dBc	An external LC should be used to reduce harmonics emission to comply with SRD requirements. See p.26.
<b>Frequency Synthesiser Section</b>					
Crystal Oscillator Frequency	3		16	MHz	Crystal frequency can be 3-4, 6-8 or 9-16 MHz. Recommended frequencies are 3.6864, 7.3728, 11.0592 and 14.7456. See page 24 for details.
Crystal frequency accuracy requirement		$\pm 50$ $\pm 25$		ppm	433 MHz 868 MHz The crystal frequency accuracy and drift (ageing and temperature dependency) will determine the frequency accuracy of the transmitted signal.
Crystal operation		Parallel			C3 and C4 are loading capacitors, see page 24
Crystal load capacitance	12	22	30	pF	3-8 MHz, 22 pF recommended
	12	16	30	pF	6-8 MHz, 16 pF recommended
	12	16	16	pF	9-16 MHz, 16 pF recommended
Crystal oscillator start-up time		4		ms	3.6864 MHz, 16 pF load
		1.5		ms	7.3728 MHz, 16 pF load
		2		ms	16 MHz, 16 pF load
Output signal phase noise		-80		dBc/Hz	At 100 kHz offset from carrier
PLL lock time		200		$\mu$ s	Up to 1 MHz frequency step
PLL turn-on time, crystal oscillator on in power down mode		250		$\mu$ s	Crystal oscillator running
<b>Digital Inputs/Outputs</b>					
Logic "0" input voltage	0		0.3*VDD	V	
Logic "1" input voltage	0.7*VDD		VDD	V	
Logic "0" output voltage	0		0.4	V	Output current -2.5 mA, 3.0 V supply voltage
Logic "1" output voltage	2.5		VDD	V	Output current 2.5 mA, 3.0 V supply voltage
Logic "0" input current	NA		-1	$\mu$ A	Input signal equals GND
Logic "1" input current	NA		1	$\mu$ A	Input signal equals VDD
DI setup time	20			ns	TX mode, minimum time DI must be ready before the positive edge of DCLK
DI hold time	10			ns	TX mode, minimum time DI must be held after the positive edge of DCLK
Serial interface (PCLK, PDATA and PALE) timing specification					See Table 2 page 11

Parameter	Min.	Typ.	Max.	Unit	Condition / Note
<b>Power Supply</b>					
Supply voltage	2.1	3.0		V	Recommended operation voltage
			3.6	V	Operating limits
Power Down mode		0.2	1	μA	Oscillator core off
Current Consumption, transmit mode 433/868 MHz:					
P=0.01mW (-20dBm)		5.5/8.0		mA	The output power is delivered to a 50Ω load
P=0.3mW (-5dBm)		7.3/10.0		mA	
P=1mW (0dBm)		9.1/14.2		mA	
P=3mW (5dBm)		13.3/17.7		mA	
P=6mW (8dBm)		15.9/24.9		mA	
P=16mW (12dBm)		23.3/NA		mA	
Current Consumption, crystal osc.		30 80 105		μA	3-8 MHz, 16 pF load 9-14 MHz, 12 pF load 14-16 MHz, 16 pF load
Current Consumption, crystal osc. and bias		400		μA	
Current Consumption, crystal osc., bias and synthesiser		4.0 5.5		mA mA	< 500 MHz > 500 MHz

## Circuit Description

**Figure 1. Simplified block diagram**

A simplified block diagram of **CC1050** is shown in Figure 1. Only signal pins are shown.

The voltage controlled oscillator (VCO) output signal is fed directly to the power amplifier (PA). The RF output is frequency shift keyed (FSK) by the digital bit stream fed to the pin DI. The single ended PA makes the antenna interface and matching very easy.

The frequency synthesiser generates the local oscillator signal which is fed to the PA in transmit mode. The frequency synthesiser consists of a crystal oscillator (OSC), phase detector (PD), charge pump (CHARGE PUMP), VCO, and frequency dividers (/R and /N). An external crystal must be connected to XOSC, and only an external inductor is required for the VCO.

The 3-wire digital serial interface (CONTROL) is used for configuration.

## Application Circuit

Very few external components are required for the operation of **CC1050**. A typical application circuit is shown in Figure 2. Component values are shown in Table 1.

### Output matching

C1, C2 and L2 are used to match the transmitter to 50 Ohm. See Output Matching p.22 for details.

### VCO inductor

The VCO is completely integrated except for the inductor L1. For further details see p. 15.

Component values for the matching network and VCO inductor are easily

calculated using the SmartRF Studio software.

### Crystal oscillator

C3 and C4 are the loading capacitors for the crystal. See page 24 for details.

### Additional filtering

Additional filtering (e.g. a low pass LC-filter) may be used in order to reduce the harmonic emission. See also Optional LC Filter p.26 for further information.

### Voltage supply decoupling

C10-C14 are voltage supply de-coupling capacitors. These capacitors should be placed as close as possible to the voltage supply pins of **CC1050**.

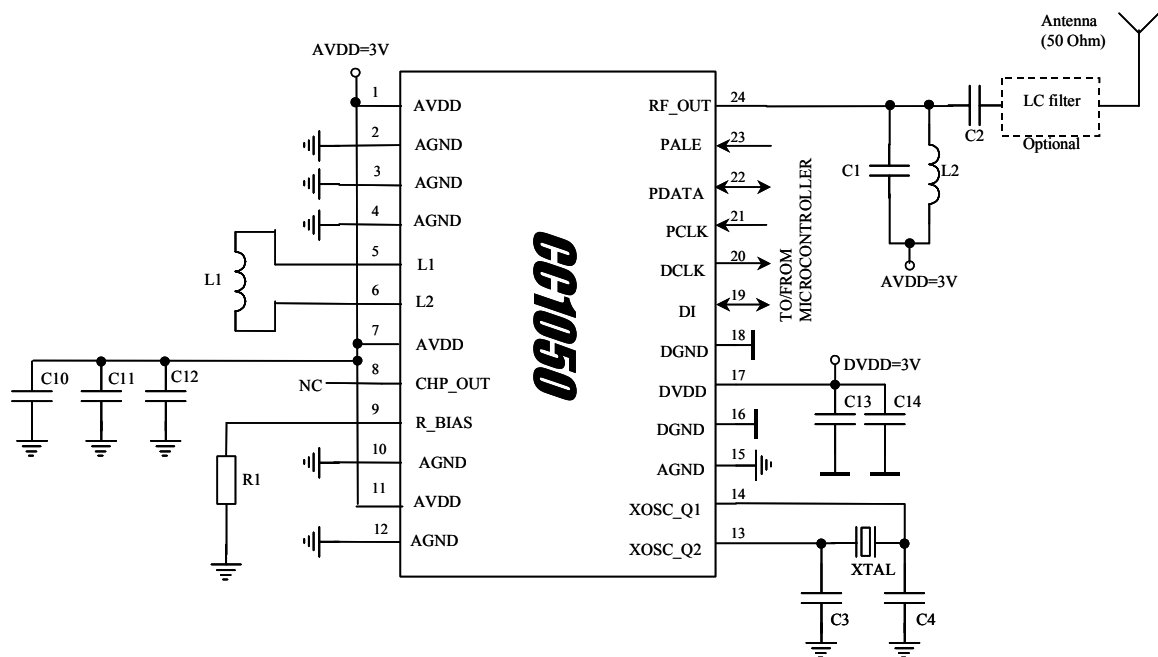

Figure 2. Typical **CC1050** application circuit

Item	315 MHz	433 MHz	868 MHz	915 MHz

Notes:

Items shaded are different for different frequencies.

Component values for 868 and 915 MHz are equal.

\*) C3 and C4 will depend on the crystal load capacitance, see page 24.

**Table 1. Bill of materials for the application circuit**

## Configuration Overview

**CC1050** can be configured to achieve the best performance for different applications. Through the programmable configuration registers the following key parameters can be programmed:

- Transmit mode / power-down / power-up mode
- RF output power
- Frequency synthesiser key parameters: RF output frequency, FSK frequency

separation (deviation), crystal oscillator reference frequency

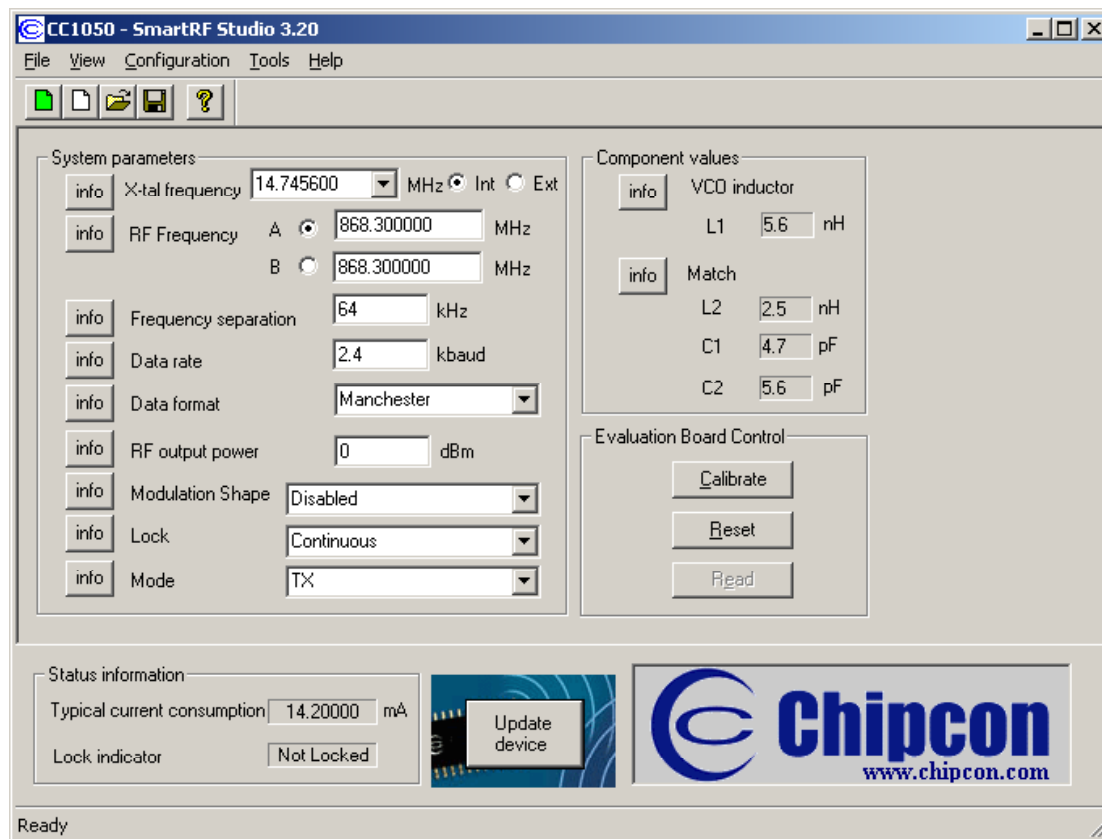

- Crystal oscillator power-up / power down
- Data rate and data format (NRZ, Manchester coded or UART interface)
- Synthesiser lock indicator mode
- Modulation spectrum shaping

## Configuration Software

Chipcon provides users of **CC1050** with a software program, SmartRF Studio (Windows interface) that generates all necessary **CC1050** configuration data based on the user's selections of various parameters. These hexadecimal numbers will then be the necessary input to the microcontroller for the configuration of

**CC1050**. In addition the program will provide the user with the component values needed for the output matching circuit and the VCO inductor.

Figure 3 shows the user interface of the **CC1050** configuration software.

**Figure 3. SmartRF Studio user interface**

### 3-wire Serial Configuration Interface

**CC1050** is configured via a simple 3-wire interface (PDATA, PCLK and PALE). There are 33 8-bit configuration registers, each addressed by a 7-bit address. A Read/Write bit initiates a read or write operation. A full configuration of **CC1050** requires sending 33 data frames of 16 bits each (7 address bits, R/W bit and 8 data bits). The time needed for a full configuration depend on the PCLK frequency. With a PCLK frequency of 10 MHz the full configuration is done in less than 53  $\mu$ s. Setting the device in power down mode requires sending one frame only and will in this case take less than 2  $\mu$ s. All registers are also readable.

In each write-cycle 16 bits are sent on the PDATA-line. The seven most significant bits of each data frame (A6:0) are the address-bits. A6 is the MSB (Most Significant Bit) of the address and is sent as the first bit. The next bit is the R/W bit (high for write, low for read). During address and R/W bit transfer the PALE (Program Address Latch Enable) must be kept low. The 8 data-bits are then transferred (D7:0). See Figure 4.

The timing for the programming is also shown in Figure 4 with reference to Table 2. The clocking of the data on PDATA is done on the negative edge of PCLK. When the last bit, D0, of the 8 data-bits has been loaded, the data word is loaded in the internal configuration register.

The configuration data is stored in internal RAM and is valid after power-down mode, but not when the power-supply is turned off. The registers can be programmed in any order.

The configuration registers can also be read by the microcontroller via the same configuration interface. The seven address bits are sent first, then the R/W bit set low to initiate the data read-back. **CC1050** then returns the data from the addressed register. PDATA is in this case used as an output and must be tri-stated (or set high in the case of an open collector pin) by the microcontroller during the data read-back (D7:0). The read operation is illustrated in Figure 5.

**Figure 4. Configuration registers write operation**

**Figure 5. Configuration registers read operation**

Parameter	Symbol	Min	Max	Units	Conditions
PCLK, clock frequency	$F_{\text{CLOCK}}$	-	10	MHz	
PCLK low pulse duration	$T_{\text{CL,min}}$	50		ns	The minimum time PCLK must be low.
PCLK high pulse duration	$T_{\text{CH,min}}$	50		ns	The minimum time PCLK must be high.
PALE setup time	$T_{\text{SA}}$	10	-	ns	The minimum time PALE must be low before negative edge of PCLK.
PALE hold time	$T_{\text{HA}}$	10	-	ns	The minimum time PALE must be held low after the <i>positive</i> edge of PCLK.
PDATA setup time	$T_{\text{SD}}$	10	-	ns	The minimum time data on PDATA must be ready before the negative edge of PCLK.
PDATA hold time	$T_{\text{HD}}$	10	-	ns	The minimum time data must be held at PDATA, after the negative edge of PCLK.
Rise time	$T_{\text{rise}}$		100	ns	The maximum rise time for PCLK and PALE
Fall time	$T_{\text{fall}}$		100	ns	The maximum fall time for PCLK and PALE

Note: The set-up- and hold-times refer to 50% of VDD.

**Table 2. Serial interface, timing specification**

## Microcontroller Interface

Used in a typical system, **CC1050** will interface to a microcontroller. This microcontroller must be able to:

- Program **CC1050** into different modes via the 3-wire serial configuration interface (PDATA, PCLK and PALE).
- Interface to the bi-directional synchronous data signal interface (DI and DCLK).

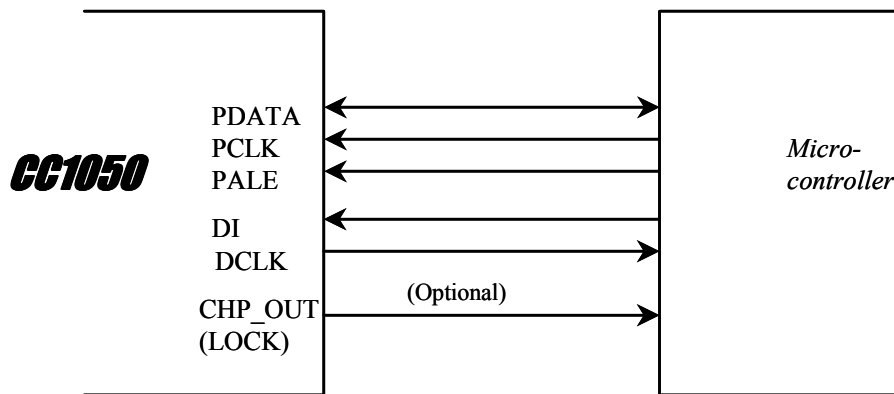

- Optionally the microcontroller can do data encoding / decoding.
- Optionally the microcontroller can monitor the frequency lock status from pin CHP\_OUT (LOCK).

### Connecting the microcontroller

The microcontroller uses 3 output pins for the configuration interface (PDATA, PCLK and PALE). PDATA should be a bi-directional pin for data read-back. The DI pin is used for data to be transmitted. DCLK providing the data timing should be connected to a microcontroller input. Optionally another pin can be used to monitor the LOCK signal (available at the CHP\_OUT pin). This signal is logic level high when the PLL is in lock. See Figure 6.

The microcontroller pins connected to PDATA and PCLK can be used for other purposes when the configuration interface is not used. PDATA and PCLK are high impedance inputs as long as PALE is not activated.

PALE has an internal pull-up resistor and should be left open (tri-stated by the microcontroller) or set to a high level during power down mode in order to prevent a trickle current flowing in the pull-up.

**Figure 6. Microcontroller interface**

## Signal interface

The signal interface consists of DI and DCLK and is used for the data to be transmitted. DI is the data input line and DCLK provides a synchronous clock during data transmission.

The **CC1050** can be used with NRZ (Non-Return-to-Zero) data or Manchester (also known as bi-phase-level) encoded data.

**CC1050** can be configured for three different data formats:

**Synchronous NRZ mode.** **CC1050** provides the data clock at DCLK, and DI is used as data input. Data is clocked into **CC1050** at the rising edge of DCLK. The data is modulated at RF without encoding. **CC1050** can be configured for the data rates 0.6, 1.2, 2.4, 4.8, 9.6, 19.2, 38.4 or 76.8 kbit/s. See Figure 7.

**Synchronous Manchester encoded mode.** **CC1050** provides the data clock at DCLK, and DI is used as data input. Data is clocked into **CC1050** at the rising edge of DCLK and should be in NRZ format. The data is modulated at RF with Manchester code. The encoding is done by **CC1050**. In this mode **CC1050** can be configured for

the data rates 0.3, 0.6, 1.2, 2.4, 4.8, 9.6, 19.2 or 38.4 kbit/s. The 38.4 kbit/s rate corresponds to the maximum 76.8 kBaud due to the Manchester encoding. See Figure 8.

**Transparent Asynchronous UART mode.** In transmit mode DI is used as data input. The data is modulated at RF without synchronisation or encoding. Data rates in the range from 0.6 to 76.8 kBaud can be used. See Figure 9.

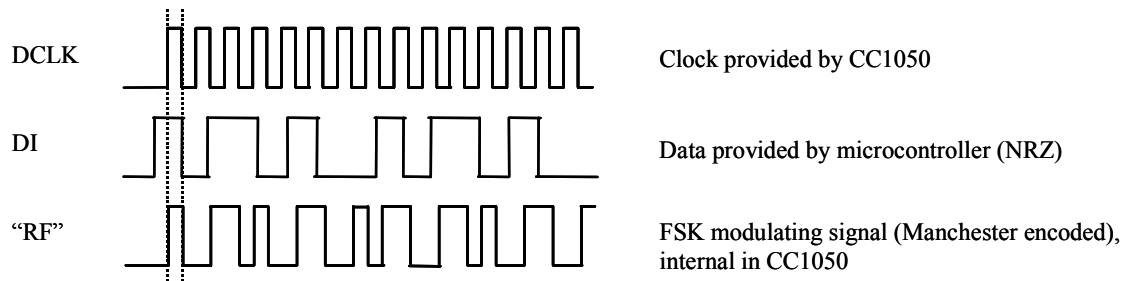

### Manchester encoding

In the **Synchronous Manchester encoded mode** **CC1050** uses Manchester coding when modulating the data. The Manchester code is based on transitions; a "0" is encoded as a low-to-high transition, a "1" is encoded as a high-to-low transition. See Figure 10.

The Manchester code ensures that the signal has a constant DC component, which is necessary in some FSK demodulators. Using this mode also ensures compatibility with CC400/CC900 designs.

**Figure 7. Synchronous NRZ mode**

**Figure 8. Synchronous Manchester encoded mode**

**Figure 9. Transparent Asynchronous UART mode**

**Figure 10. Manchester encoding**

## Frequency programming

The operation frequency is set by programming the frequency word in the configuration registers. There are two frequency words registers, termed *A* and *B*, which can be programmed to two different frequencies in order to jump fast between two different channels. Frequency word *A* or *B* is selected by the *F\_REG* bit in the *MAIN* register.

The frequency word is 24 bits (3 bytes) located in *FREQ\_2A:FREQ\_1A:FREQ\_0A* and *FREQ\_2B:FREQ\_1B:FREQ\_0B* for the *A* and *B* word respectively.

The FSK frequency separation is programmed in the *FSEP1:FSEP0* registers (11 bits).

The frequency word *FREQ* is calculated by:

$$f_{VCO} = f_{ref} \cdot \frac{FREQ + 8192}{16384}$$

where the reference frequency is the crystal oscillator clock divided by *REFDIV* (4 bits in the *PLL* register), a number between 2 and 15:

$$f_{ref} = \frac{f_{xosc}}{REFDIV}$$

The equation above gives the VCO frequency, that is,  $f_{VCO}$  is the  $f_0$  frequency for transmit mode (lower FSK frequency).

The upper FSK frequency is given by:

$$f_1 = f_0 + f_{sep}$$

where  $f_{sep}$  is set by the separation word:

$$f_{sep} = f_{ref} \cdot \frac{FSEP}{16384}$$

## VCO

Only one external inductor (L1) is required for the VCO. The inductor will determine the operating frequency range of the circuit. It is important to place the inductor as close to the pins as possible in order to reduce stray inductance. It is recommended to use a high Q, low tolerance inductor for best performance.

Typical tuning range for the integrated varactor is 20-25%.

Component values for various frequencies are given in Table 1. Component values for other frequencies can be found using the SmartRF Studio software.

## VCO and PLL self-calibration

To compensate for supply voltage, temperature and process variations the VCO and PLL must be calibrated. The calibration is done automatically and sets maximum VCO tuning range and optimum charge pump current for PLL stability. After setting up the device at the operating frequency, the self-calibration can be initiated by setting the *CAL\_START* bit. The calibration result is stored internally in the chip, and is valid as long as power is not turned off. If large supply voltage variations (more than 0.5 V) or temperature variations (more than 40 degrees) occur after calibration, a new calibration should be performed.

The self-calibration is controlled through the *CAL* register (see configuration registers description p. 29). The *CAL\_COMPLETE* bit indicates complete calibration. The user can poll this bit, or simply wait for 26 ms (calibration wait time when *CAL\_WAIT* = 1). The wait time is proportional to the internal PLL reference frequency. The lowest permitted reference frequency (1 MHz) gives 26 ms wait time, which is therefore the worst case.

Reference frequency [MHz]	Calibration time [ms]
2.4	11
2.0	13
1.5	18
1.0	26

The *CAL\_COMPLETE* bit can also be monitored at the *CHP\_OUT* (LOCK) pin (configured by *LOCK\_SELECT[3:0]*) and used as an interrupt input to the microcontroller.

The *CAL\_START* bit must be set to 0 by the microcontroller after the calibration is done.

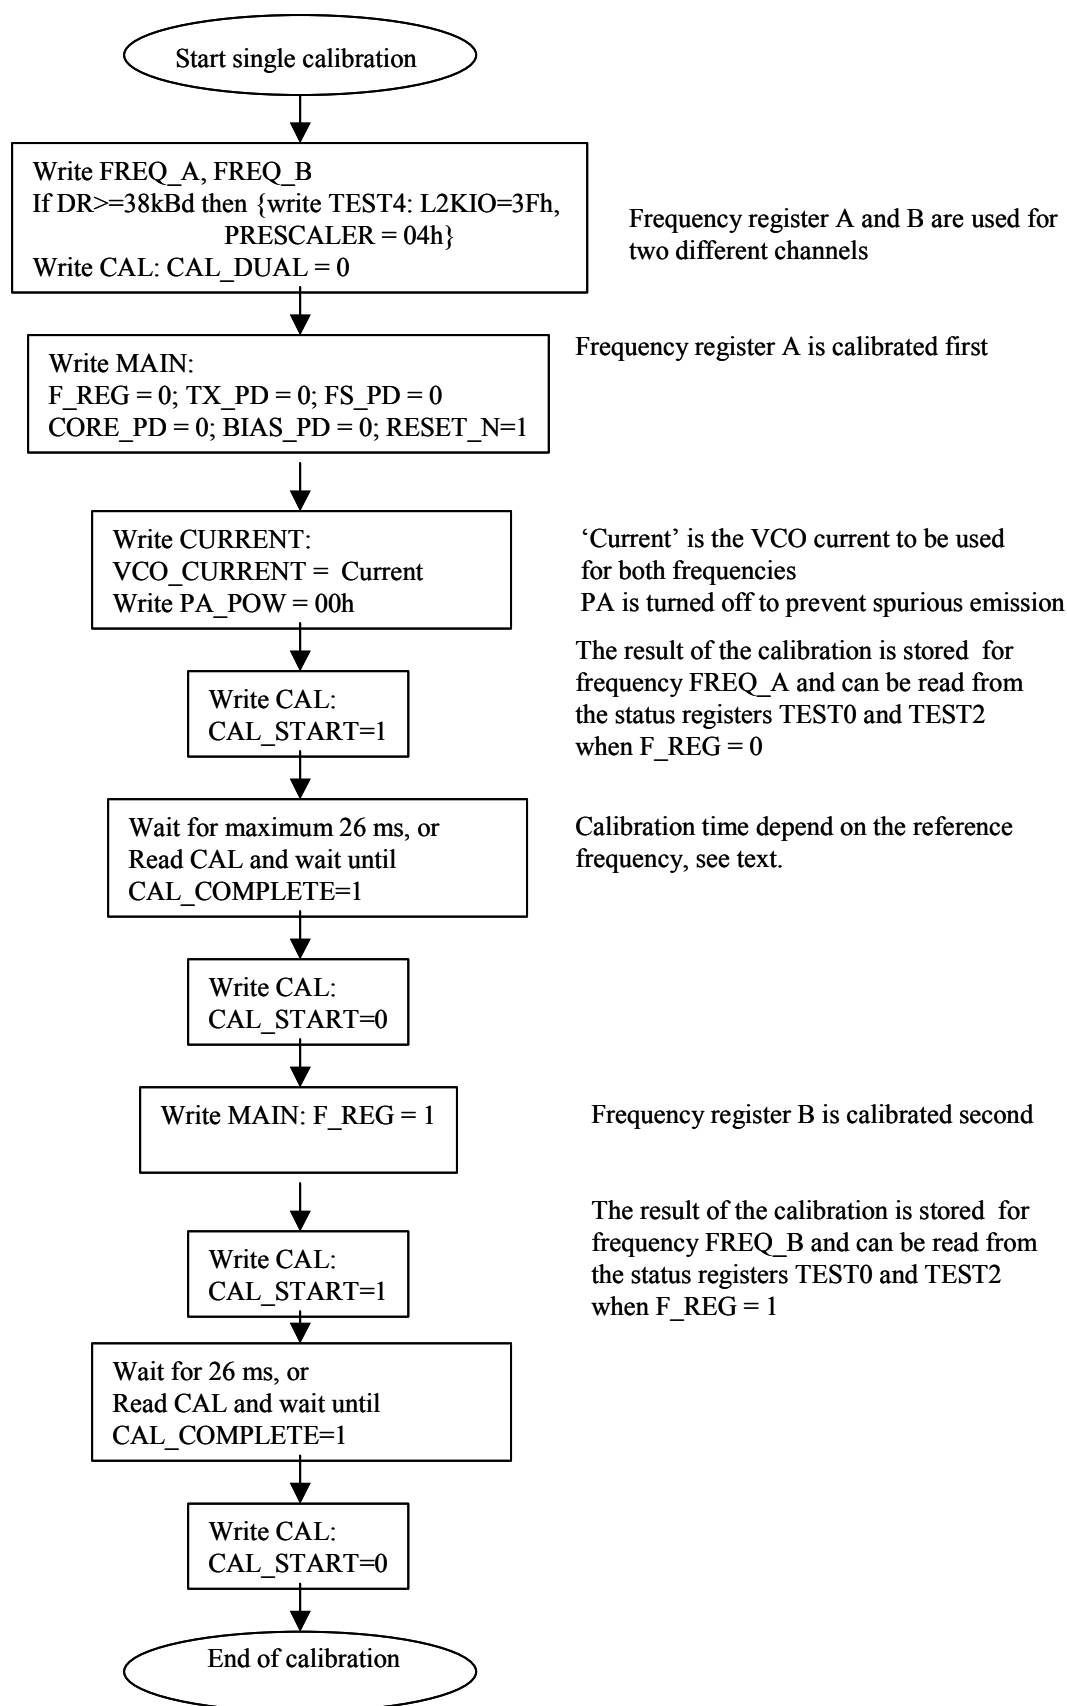

There are separate calibration values for the two frequency registers. If the two frequencies, A and B, differ more than 1 MHz, or different VCO currents are used

(*VCO\_CURRENT[3:0]* in the *CURRENT* register) the calibration should be done separately. The *CAL\_DUAL* bit in the *CAL* register controls dual or separate calibration.

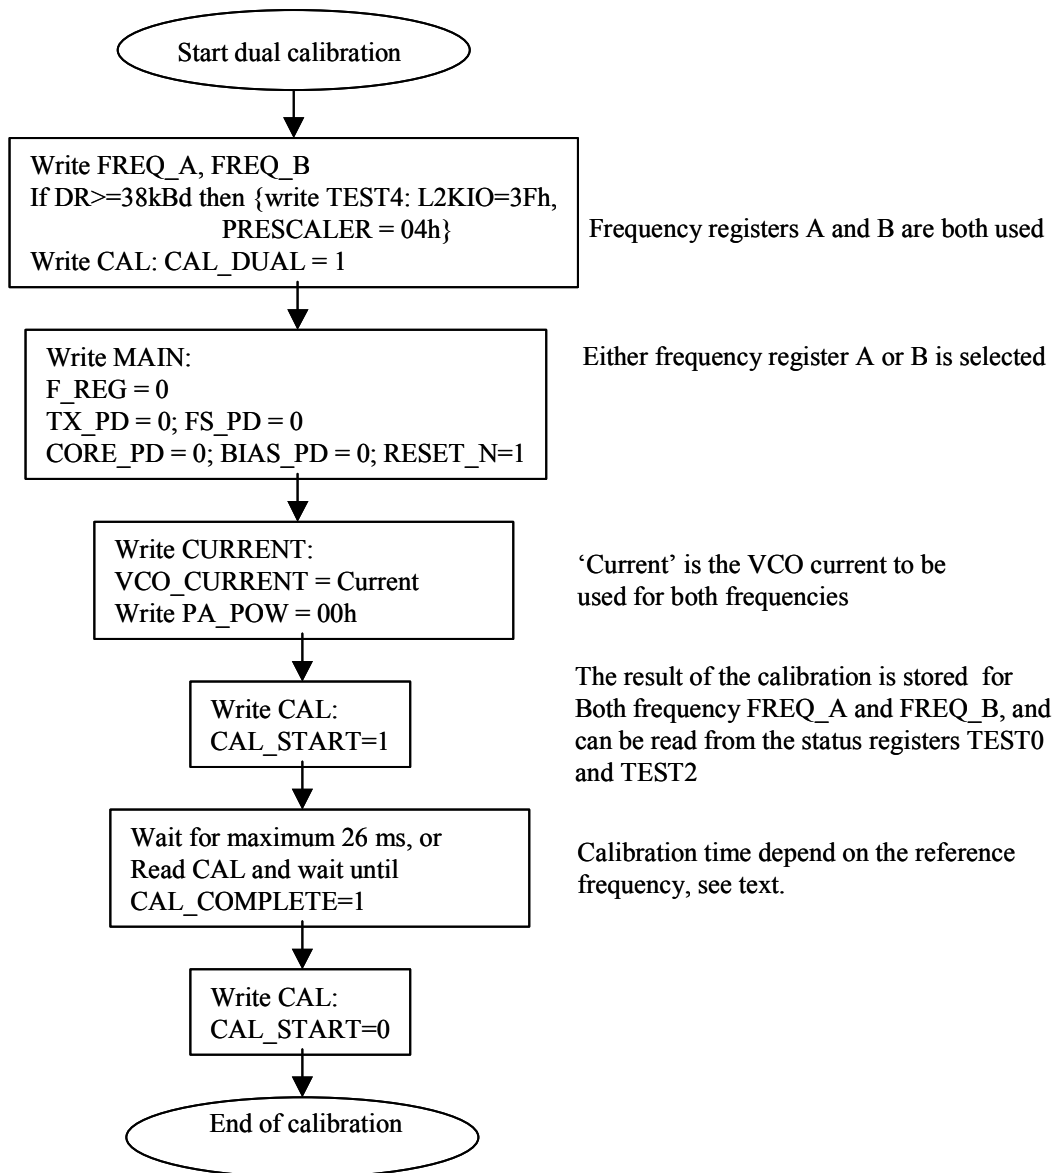

The single calibration algorithm using separate calibration for two frequencies is illustrated in Figure 11.

In Figure 12 the dual calibration algorithm is shown.

**Figure 11. Single calibration algorithm for two different frequencies**

**Figure 12. Dual calibration algorithm**

## VCO current control

The VCO current is programmable and should be set according to operating frequency and output power. Recommended settings for the *VCO\_CURRENT* bits in the *CURRENT* register are shown in the tables on page 31.

The bias current for the PA buffers are also programmable. Recommended

settings for the *PA\_DRIVE* bits in the *CURRENT* register are shown in the tables on page 31.

## Power management

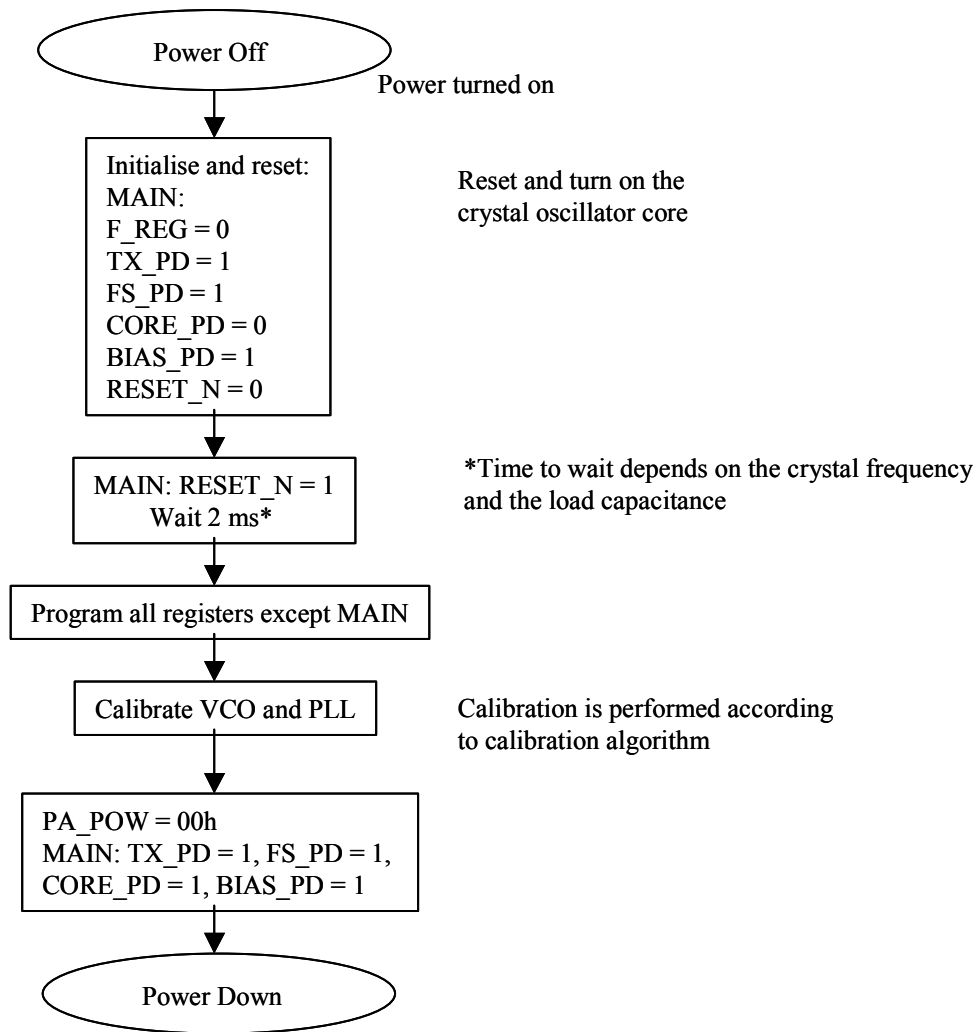

**CC1050** offers great flexibility for power management in order to meet strict power consumption requirements in battery operated applications. Power Down mode is controlled through the *MAIN* register. There are separate bits to control the TX part, the frequency synthesiser and the crystal oscillator. This individual control can be used to optimise for lowest possible current consumption in a certain application.

A typical power-on and initialising sequence for minimum power

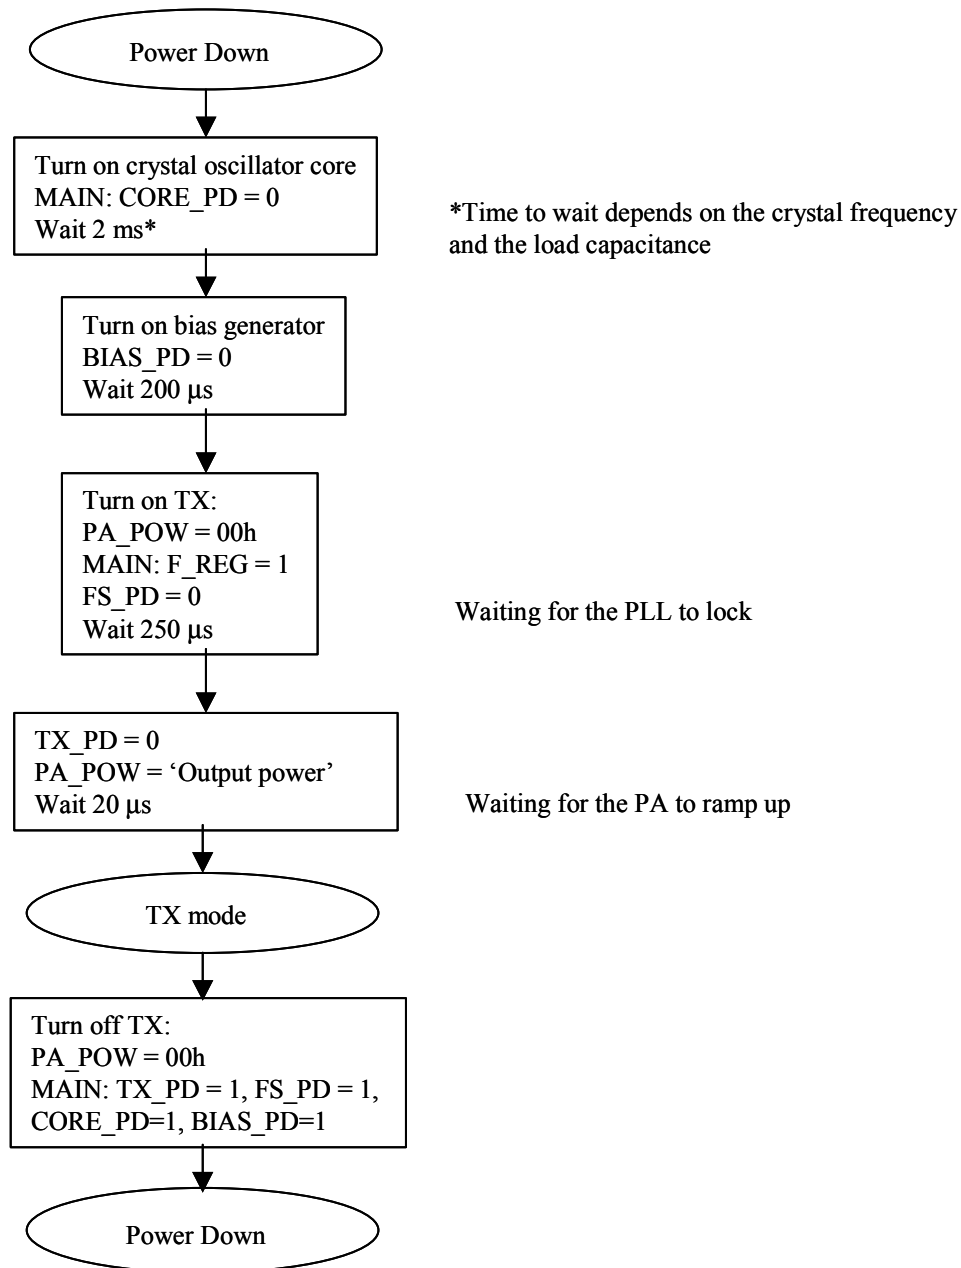

consumption is shown in Figure 13 and Figure 14.

PALE should be tri-stated or set to a high level during power down mode in order to prevent a trickle current from flowing in the internal pull-up resistor.

PA\_POW should be set to 00h during power down mode to ensure lowest possible leakage current.

**Figure 13. Initializing sequence**

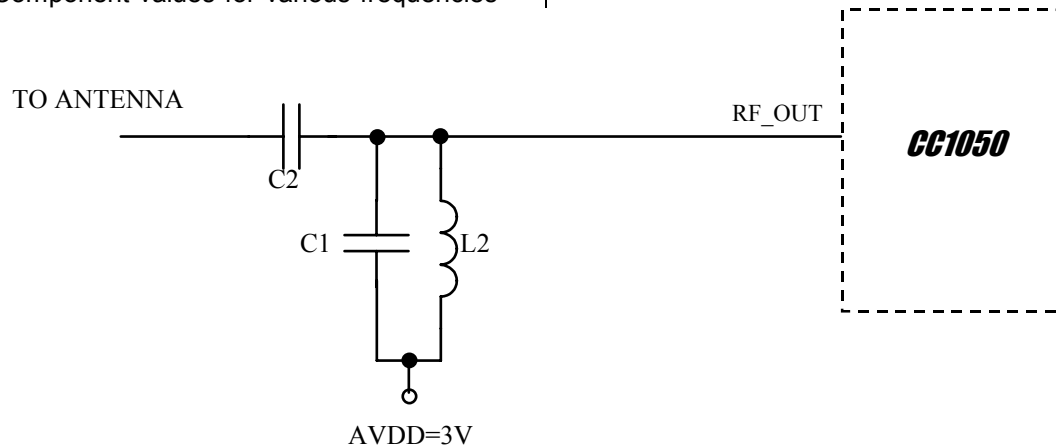

**Figure 14. Sequence for activating TX mode**

## Output Matching

A few passive external components ensures match in TX mode. The matching network is shown in Figure 15. Component values for various frequencies

are given in Table 1. Component values for other frequencies can be found using the configuration software.

**Figure 15. Output matching network**

### Output power programming

The RF output power is programmable and controlled by the PA\_POW register. Table 3 shows the closest programmable value for output powers in steps of 1 dB. The typical current consumption is also shown.

In power down mode the PA\_POW should be set to 00h for minimum leakage current.

Output power [dBm]	RF frequency 433 MHz		RF frequency 868 MHz	
	PA_POW [hex]	Current consumption, typ. [mA]	PA_POW [hex]	Current consumption, typ. [mA]
-20	01	5.5	02	8.0
-19	01	5.5	02	8.0
-18	01	5.5	02	8.0

## Crystal oscillator

An external clock signal or the internal crystal oscillator can be used as main frequency reference. An external clock signal should be connected to XOSC\_Q1, while XOSC\_Q2 should be left open. The XOSC\_BYPASS bit in the XOSC register should be set when an external clock signal is used.

The crystal frequency should be in the range 3-4, 6-8 or 9-16 MHz. Because the crystal frequency is used as reference for the data rate (as well as other internal functions), the following frequencies are recommended: 3.6864, 7.3728, 11.0592 or 14.7456 MHz. These frequencies will give accurate data rates. The crystal frequency range is selected by XOSC\_FREQ1:0 in the MODEM0 register.

To operate in synchronous mode at data rates different from the standards at 1.2, 2.4, 4.8 kBaud and so on, the crystal frequency can be scaled. The data rate (DR) will change proportionally to the new crystal frequency (f). To calculate the new crystal frequency:

$$f_{xtal\_new} = f_{xtal} \frac{DR_{new}}{DR}$$

Using the internal crystal oscillator, the crystal must be connected between

XOSC\_Q1 and XOSC\_Q2. The oscillator is designed for parallel mode operation of the crystal. In addition loading capacitors (C3 and C4) for the crystal are required. The loading capacitor values depend on the total load capacitance,  $C_L$ , specified for the crystal. The total load capacitance seen between the crystal terminals should equal  $C_L$  for the crystal to oscillate at the specified frequency.

$$C_L = \frac{1}{\frac{1}{C_3} + \frac{1}{C_4}} + C_{parasitic}$$

The parasitic capacitance is constituted by pin input capacitance and PCB stray capacitance. Typically the total parasitic capacitance is 8 pF. A trimming capacitor may be placed across C4 for initial tuning if necessary.

The crystal oscillator circuit is shown in Figure 16. Typical component values for different values of  $C_L$  are given in Table 4.

The initial tolerance, temperature drift, ageing and load pulling should be carefully specified in order to meet the required frequency accuracy in a certain application.

Figure 16. Crystal oscillator circuit

Item	$C_L = 12$ pF	$C_L = 16$ pF	$C_L = 22$ pF
C3	6.8 pF	15 pF	27 pF
C4	6.8 pF	15 pF	27 pF

Table 4. Crystal oscillator component values

## Frequency spectrum shaping and dithering

The **CC1050** has the unique possibility of frequency spectrum shaping and dithering. The inherent abrupt frequency change using FSK modulation gives a broad RF spectrum. By using a smooth frequency shift, the spectrum broadening can be reduced, see Figure 17. This smooth frequency shift can be implemented by stepping through several intermediate frequencies between the two FSK frequencies. **CC1050** use 16 step-frequencies that are specified in the seven *FSHAPE* registers. The frequency steps are made anti-symmetrical, hence only seven values are specified to define the 16 steps, see Figure 18. The data shaping is turned on using the *SHAPE* bit in the *FSCTRL* register.

The maximum frequency separation using frequency shaping is  $FSEP = 63$ .

The time-step is programmed in the *FSDELAY* register. This value should correspond to the data rate used. For

equal spacing of steps through one baud period, use

$$FSDELAY = \frac{f_{ref}}{16 \cdot BaudRate} - 1$$

where the reference frequency,  $f_{ref}$ , is the crystal oscillator clock divided by *REFDIV*. Shorter time-steps could also be used.

The default values after reset correspond to a raised cosine frequency change for maximum deviation.

Dithering of the PLL can be used to reduce spurious signals originating from internal reference frequencies. The dithering is turned on by the *DITHER1* and *DITHER0* bits in the *FSCTRL* register.

**Figure 17. FSK spectrum shaping by smooth frequency transitions**

**Figure 18. Stepwise frequency shaping**

### Optional LC Filter

An optional LC filter may be added between the antenna and the matching network in certain applications. The filter will reduce the emission of harmonics.

The filter topology is shown in Figure 19. Component values are given in Table 5. The filter is designed for 50  $\Omega$  terminations. The component values may have to be tuned to compensate for layout parasitics.

**Figure 19. LC filter**

Item	315 MHz	433 MHz	868 MHz	915 MHz
C71	30 pF	20 pF	10 pF	10 pF
C72	30 pF	20 pF	10 pF	10 pF
L71	15 nH	12 nH	5.6 nH	4.7 nH

**Table 5. LC filter component values**

---

## System Considerations and Guidelines

### SRD regulations

International regulations and national laws regulate the use of radio receivers and transmitters. SRDs (Short Range Devices) for licence free operation are allowed to operate in the 433 and 868-870 MHz bands in most European countries. In the United States such devices operate in the 260–470 and 902-928 MHz bands. **CC1050** is designed to meet the requirements for operation in all these bands. A summary of the most important aspects of these regulations can be found in Application Note *AN001 SRD regulations for licence free transceiver operation*, available from Chipcon's web site.

### Low cost systems

In systems where low cost is of great importance the **CC1050** is the ideal choice. Very few external components keep the total cost at a minimum. The oscillator crystal can then be a low cost crystal with 50 ppm frequency tolerance.

### Battery operated systems

In low power applications the power down mode should be used when not being active. Depending on the start-up time requirement, the oscillator core can be powered during power down. See page 19 for information on how effective power management can be implemented.

### Narrow band systems

**CC1050** can also be used in narrow band systems, but CC400 and CC900 are recommended for best performance in such applications. The phase noise of CC400 / CC900 is superior and for systems with 25 kHz channel spacing with strict requirements to ACP (Adjacent Channel Power) low phase noise is important.

A unique feature in **CC1050** is the very fine frequency resolution of 250 Hz. This can be used to do the temperature compensation of the crystal if the

temperature drift curve is known and a temperature sensor is included in the system. Even initial adjustment can be done using the frequency programmability. This eliminates the need for an expensive TCXO and trimming in some applications. In less demanding applications a crystal with low temperature drift and low ageing could be used without further compensation. A trimmer capacitor in the crystal oscillator circuit (in parallel with C4) could be used to set the initial frequency accurately.

**CC1050** also exhibits a unique spectrum-shaping feature in order to improve the ACP even for large data rates. In 'true' FSK systems with abrupt frequency shifting the spectrum is inherently broad. By making the frequency shift 'softer' the spectrum can be made significantly narrower. Thus, higher data rates can be transmitted in the same bandwidth.

### High output power systems

The CHP\_OUT (LOCK) pin can be configured to control an power amplifier. This is controlled by *LOCK\_SELECT* in the *LOCK* register.

### Frequency hopping spread spectrum systems

Due to the very fast frequency shift properties of the PLL, the **CC1050** is also suitable for frequency hopping systems. Hop rates of 1-100 hops/s are usually used depending on the bit rate and the amount of data to be sent during each transmission. The two frequency registers (*FREQ\_A* and *FREQ\_B*) are designed such that the 'next' frequency can be programmed while the 'present' frequency is used. The switching between the two frequencies is done through the *MAIN* register.

## PCB Layout Recommendations

A two layer PCB is highly recommended. The bottom layer of the PCB should be the “ground-layer”. Chipcon provide reference designs that should be followed in order to achieve the best performance.

The top layer should be used for signal routing, and the open areas should be filled with metallisation connected to ground using several vias.

The ground pins should be connected to ground as close as possible to the package pin using individual vias. The de-coupling capacitors should also be placed as close as possible to the supply pins and connected to the ground plane by separate vias.

The external components should be as small as possible and surface mount devices should be used.

Precaution should be used when placing the microcontroller in order to avoid interference with the RF circuitry.

In certain applications where the ground plane for the digital circuitry is expected to be noisy, the ground plane may be split in an analogue and a digital part. All AGND pins and AVDD de-coupling capacitors should be connected to the analogue ground plane. All DGND pins and DVDD de-coupling capacitors should be connected to the digital ground. The connection between the two ground planes should be implemented as a star connection with the power supply ground.

A development kit with a fully assembled PCB is available, and can be used as a guideline for layout.

## Antenna Considerations

**CC1050** can be used together with various types of antennas. The most common antennas for short range communication are monopole, helical and loop antennas.

Monopole antennas are resonant antennas with a length corresponding to one quarter of the electrical wavelength ( $\lambda/4$ ). They are very easy to design and can be implemented simply as a “piece of wire” or even integrated into the PCB.

Non-resonant monopole antennas shorter than  $\lambda/4$  can also be used, but at the expense of range. In size and cost critical applications such an antenna may very well be integrated into the PCB.

Helical antennas can be thought of as a combination of a monopole and a loop antenna. They are a good compromise in size critical applications. But helical antennas tend to be more difficult to optimise than the simple monopole.

Loop antennas are easy to integrate into the PCB, but are less effective due to

difficult impedance matching because of their very low radiation resistance.

For low power applications the  $\lambda/4$ -monopole antenna is recommended giving the best range and because of its simplicity.

The length of the  $\lambda/4$ -monopole antenna is given by:

$$L = 7125 / f$$

where f is in MHz, giving the length in cm. An antenna for 869 MHz should be 8.2 cm, and 16.4 cm for 434 MHz.

The antenna should be connected as close as possible to the IC. If the antenna is located away from the input pin the antenna should be matched to the feeding transmission line (50  $\Omega$ ).

For a more thorough primer on antennas, please refer to Application Note AN003 *SRD Antennas* available from Chipcon’s web site.

## Configuration registers

The configuration of **CC1050** is done by programming the 33 8-bit configuration registers. The configuration data based on selected system parameters are most easily found by using the SmartRF Studio software. A complete description of the

registers are given in the following tables. After a RESET is programmed all the registers have default values. The TEST registers are also set to default values after a RESET, and should not be altered by the user.

### REGISTER OVERVIEW

ADDRESS	Byte Name	Description
00h	MAIN	MAIN Register
01h	FREQ_2A	Frequency Register 2A
02h	FREQ_1A	Frequency Register 1A
03h	FREQ_0A	Frequency Register 0A
04h	FREQ_2B	Frequency Register 2B
05h	FREQ_1B	Frequency Register 1B
06h	FREQ_0B	Frequency Register 0B
07h	FSEP1	Frequency Separation Register 1
08h	FSEP0	Frequency Separation Register 0
09h	CURRENT	Current Consumption Control Register
0Ah	XOSC	Crystal Oscillator Control Register
0Bh	PA_POW	PA Output Power Control Register
0Ch	PLL	PLL Control Register
0Dh	LOCK	LOCK Status Register and signal select to CHP_OUT (LOCK) pin
0Eh	CAL	VCO Calibration Control and Status Register
0Fh	Not used	Not used
10h	Not used	Not used
11h	MODEM0	Modem Control Register
12h	Not used	Not used
13h	FSCTRL	Frequency Synthesiser Control Register
14h	FSHAPE7	Frequency Shaping Register 7
15h	FSHAPE6	Frequency Shaping Register 6
16h	FSHAPE5	Frequency Shaping Register 5
17h	FSHAPE4	Frequency Shaping Register 4
18h	FSHAPE3	Frequency Shaping Register 3
19h	FSHAPE2	Frequency Shaping Register 2
1Ah	FSHAPE1	Frequency Shaping Register 1
1Bh	FSDELAY	Frequency Shaping Delay Register
1Ch	PRESCALER	Prescaler Control Register
40h	TEST6	Test register for PLL LOOP
41h	TEST5	Test register for PLL LOOP
42h	TEST4	Test register for PLL LOOP
43h	TEST3	Test register for VCO
44h	TEST2	Test register for Calibration
45h	TEST1	Test register for Calibration
46h	TEST0	Test register for Calibration

**MAIN Register (00h)**

REGISTER	NAME	Default value	Active	Description
MAIN[7]	-	-	-	Not used
MAIN[6]	F_REG	-	-	Selection of Frequency Register, 0 : Register A, 1 : Register B
MAIN[5]	-	-	-	Not used
MAIN[4]	TX_PD	-	H	Power Down of Signal Interface and PA
MAIN[3]	FS_PD	-	H	Power Down of Frequency Synthesiser
MAIN[2]	CORE_PD	-	H	Power Down of Crystal Oscillator Core
MAIN[1]	BIAS_PD	-	H	Power Down of BIAS (Global_Current_Generator) and Crystal Oscillator Buffer
MAIN[0]	RESET_N	-	L	Reset, active low. Writing RESET_N low will write default values to all other registers than MAIN. Bits in MAIN do not have a default value, and will be written directly through the configurations interface. Must be set high to complete reset.

**FREQ\_2A Register (01h)**

REGISTER	NAME	Default value	Active	Description
FREQ_2A[7:0]	FREQ_A[23:16]	01110101	-	8 MSB of frequency control word A

**FREQ\_1A Register (02h)**

REGISTER	NAME	Default value	Active	Description
FREQ_1A[7:0]	FREQ_A[15:8]	10100000	-	Bit 15 to 8 of frequency control word A

**FREQ\_0A Register (03h)**

REGISTER	NAME	Default value	Active	Description
FREQ_0A[7:0]	FREQ_A[7:0]	11001011	-	8 LSB of frequency control word A

**FREQ\_2B Register (04h)**

REGISTER	NAME	Default value	Active	Description
FREQ_2B[7:0]	FREQ_B[23:16]	01110101	-	8 MSB of frequency control word B

**FREQ\_1B Register (05h)**

REGISTER	NAME	Default value	Active	Description
FREQ_1B[7:0]	FREQ_B[15:8]	10100101	-	Bit 15 to 8 of frequency control word B

**FREQ\_0B Register (06h)**

REGISTER	NAME	Default value	Active	Description
FREQ_0B[7:0]	FREQ_B[7:0]	01001110	-	8 LSB of frequency control word B

**FSEP1 Register (07h)**

REGISTER	NAME	Default value	Active	Description
FSEP1[7:3]	-	-	-	Not used
FSEP1[2:0]	FSEP_MSB[2:0]	000	-	3 MSB of frequency separation control

**FSEP0 Register (08h)**

REGISTER	NAME	Default value	Active	Description
FSEP0[7:0]	FSEP_LSB[7:0]	01011001	-	8 LSB of frequency separation control

**CURRENT Register (09h)**

REGISTER	NAME	Default value	Active	Description
CURRENT[7:4]	VCO_CURRENT[3:0]	1100	-	Control of current in VCO core 0000 : 160μA 0001 : 320μA 0010 : 480μA 0011 : 630μA 0100 : 790μA 0101 : 950μA 0110 : 1100μA 0111 : 1250μA 1000 : 1560μA, use for f< 500 MHz 1001 : 1720μA 1010 : 1870μA 1011 : 2030μA 1100 : 2180μA 1101 : 2340μA 1110 : 2490μA 1111 : 2640μA, use for f>500 MHz
CURRENT[3:2]	-	-	-	Not used
CURRENT[1:0]	PA_DRIVE[1:0]	10	-	Control of current in VCO buffer for PA 00 : 1mA 01 : 2mA, use for TX, f<500 MHz 10 : 3mA 11 : 4mA, use for TX, f>500 MHz

**XOSC Register (0Ah)**

REGISTER	NAME	Default value	Active	Description
XOSC[7:1]	-	-	-	Not used
XOSC[0]	XOSC_BYPASS	0	-	0 : Internal XOSC enabled 1 : Power-Down of XOSC, external CLK used

PA\_POW Register (0Bh)

REGISTER	NAME	Default value	Active	Description
PA_POW[7:4]	PA_HIGHPOWER[3:0]	0000	-	Control of output power in high power array. Should be 0000 in PD mode. See Table 3 page 23 for details.
PA_POW[3:0]	PA_LOWPOWER[3:0]	1111	-	Control of output power in low power array. Should be 0000 in PD mode. See Table 3 page 23 for details.

PLL Register (0Ch)

REGISTER	NAME	Default value	Active	Description
PLL[7]	EXT_FILTER	0	-	1 : External loop filter 0 : Internal loop filter  1-to-0 transition samples F_COMP comparator when BREAK_LOOP=1 (TEST3)
PLL[6:3]	REFDIV[3:0]	0010	-	Reference divider  0000 : Not allowed 0001 : Not allowed 0010 : Divide by 2 0011 : Divide by 3 ..... 1111 : Divide by 15
PLL[2]	ALARM_DISABLE	0	h	0 : Alarm function enabled 1 : Alarm function disabled
PLL[1]	ALARM_H	-	-	Status bit for tuning voltage out of range (too close to VDD)
PLL[0]	ALARM_L	-	-	Status bit for tuning voltage out of range (too close to GND)

**LOCK Register (0Dh)**

REGISTER	NAME	Default value	Active	Description
LOCK[7:4]	LOCK_SELECT[3:0]	0000	-	Selection of signals to CHP_OUT (LOCK) pin  0000 : Normal, pin can be used as CHP_OUT 0001 : LOCK_CONTINUOUS (active high) 0010 : LOCK_INSTANT (active high) 0011 : ALARM_H (active high) 0100 : ALARM_L (active high) 0101 : CAL_COMPLETE (active high) 0110 : Not used 0111 : REFERENCE_DIVIDER Output 1000 : TX_PDB (active high, activates external PA when TX_PD=0) 1001 : Not used 1010 : Not used 1011 : Not used 1100 : Not used 1101 : Not used 1110 : N_DIVIDER Output 1111 : F_COMP
LOCK[3]	PLL_LOCK_ACCURACY	0	-	0 : Sets Lock Threshold = 127, Reset Lock Threshold = 111. Corresponds to a worst case accuracy of 0.7% 1 : Sets Lock Threshold = 31, Reset Lock Threshold = 15. Corresponds to a worst case accuracy of 2.8%
LOCK[2]	PLL_LOCK_LENGTH	0	-	0 : Normal PLL lock window 1 : Not used
LOCK[1]	LOCK_INSTANT	-	-	Status bit from Lock Detector
LOCK[0]	LOCK_CONTINUOUS	-	-	Status bit from Lock Detector

**CAL Register (0Eh)**

REGISTER	NAME	Default value	Active	Description
CAL[7]	CAL_START	0	↑	↑ 1 : Calibration started 0 : Calibration inactive CAL_START must be set to 0 after calibration is done
CAL[6]	CAL_DUAL	0	H	1 : Store calibration in both A and B 0 : Store calibration in A or B defined by MAIN[6]
CAL[5]	CAL_WAIT	0	H	1 : Normal Calibration Wait Time 0 : Half Calibration Wait Time  The calibration time is proportional to the internal reference frequency. 2 MHz reference frequency gives 14 ms wait time.
CAL[4]	CAL_CURRENT	0	H	1 : Calibration Current Doubled 0 : Normal Calibration Current
CAL[3]	CAL_COMPLETE	0	H	Status bit defining that calibration is complete
CAL[2:0]	CAL_ITERATE	101	H	Iteration start value for calibration DAC 000 - 101: Not used 110 : Normal start value 111 : Not used

**MODEM0 Register (11h)**

REGISTER	NAME	Default value	Active	Description
MODEM0[7]	-	-	-	Not used
MODEM0[6:4]	BAUDRATE[2:0]	010	-	000 : 0.6 kBaud 001 : 1.2 kBaud 010 : 2.4 kBaud 011 : 4.8 kBaud 100 : 9.6 kBaud 101 : 19.2 kBaud 110 : 38.4 kBaud 111 : 76.8 kBaud
MODEM0[3:2]	DATA_FORMAT[1:0]	01	-	00 : NRZ operation. 01 : Manchester operation 10 : Transparent Asynchronous UART operation 11 : Not used
MODEM0[1:0]	XOSC_FREQ[1:0]	00	-	Selection of XTAL frequency range 00 : 3MHz - 4MHz crystal, 3.6864MHz recommended 01 : 6MHz - 8MHz crystal, 7.3728MHz recommended 10 : 9MHz - 12MHz crystal, 11.0592 MHz recommended 11 : 12MHz - 16MHz crystal, 14.7456MHz recommended

**FSCTRL Register (13h)**

REGISTER	NAME	Default value	Active	Description
FSCTRL[7:4]	-	-	-	Not used
FSCTRL[3]	DITHER1	0	H	Enable dithering when transmitting '1'
FSCTRL[2]	DITHER0	0	H	Enable dithering when transmitting '0'
FSCTRL[1]	SHAPE	0	H	Enable data shaping
FSCTRL[0]	FS_RESET_N	1	L	Separate reset of shaping sequencer

**FSHAPE7 Register (14h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE7[7:5]	--	-	-	Not used
FSHAPE7[4:0]	FSHAPE7	00001	-	Frequency shape register 7, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE6 Register (15h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE6[7:5]	-	-	-	Not used
FSHAPE6[4:0]	FSHAPE6	00011	-	Frequency shape register 6, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE5 Register (16h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE5[7:5]	-	-	-	Not used
FSHAPE5[4:0]	FSHAPE5	00110	-	Frequency shape register 5, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE4 Register (17h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE4[7:5]	-	-	-	Not used
FSHAPE4[4:0]	FSHAPE4	01010	-	Frequency shape register 4, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE3 Register (18h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE3[7:5]	-	-	-	Not used
FSHAPE3[4:0]	FSHAPE3	10000	-	Frequency shape register 3, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE2 Register (19h)**

REGISTER	NAME	Default value	Active	Description
FSHAPE2[7:5]	-	-	-	Not used
FSHAPE2[4:0]	FSHAPE2	10110	-	Frequency shape register 2, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSHAPE1 Register (1Ah)**

REGISTER	NAME	Default value	Active	Description
FSHAPE1[7:5]	-	-	-	Not used
FSHAPE1[4:0]	FSHAPE1	11100	-	Frequency shape register 1, used when <i>SHAPE</i> in <i>FSCTRL</i> is active.

**FSDELAY Register (1Bh)**

REGISTER	NAME	Default value	Active	Description
FSDELAY[7:0]	FSDELAY[7:0]	00101111	-	Sets the number of clock cycles delay between the use of the FSHAPE registers during frequency shaping

**PRESCALER Register (1Ch)**

REGISTER	NAME	Default value	Active	Description
PRESCALER[7:6]	PRE_SWING[1:0]	00	-	Prescaler swing. Fractions for PRE_CURRENT[1:0] = 00  00 : 1 * Nominal Swing 01 : 2/3 * Nominal Swing 10 : 7/3 * Nominal Swing 11 : 5/3 * Nominal Swing
PRESCALER[5:4]	PRE_CURRENT [1:0]	00	-	Prescaler current scaling  00 : 1 * Nominal Current 01 : 2/3 * Nominal Current 10 : 1/2 * Nominal Current 11 : 2/5 * Nominal Current
PRESCALER[3]	BYPASS_R	0	H	Bypass the resistor in the PLL loop filter 0 : Not bypassed 1 : Bypassed
PRESCALER[2]	DISCONNECT_C	0	-	Disconnect the capacitor in the PLL loop filter 0 : Capacitor connected 1 : Capacitor disconnected. Use for data rate 38.4 and 76.8 kBaud only.
PRESCALER[1:0]	-	-	-	Not used

**TEST6 Register (for test only, 40h)**

REGISTER	NAME	Default value	Active	Description
TEST6[7]	LOOPFILTER_TP1	0	-	1 : Select testpoint 1 to CHP_OUT 0 : CHP_OUT tied to GND
TEST6 [6]	LOOPFILTER_TP2	0	-	1 : Select testpoint 2 to CHP_OUT 0 : CHP_OUT tied to GND
TEST6 [5]	CHP_OVERRIDE	0	-	1 : use CHP_CO[4:0] value 0 : use calibrated value
TEST6[4:0]	CHP_CO[4:0]	10000	-	Charge_Pump Current DAC override value

**TEST5 Register (for test only, 41h)**

REGISTER	NAME	Default value	Active	Description
TEST5[7:6]	-	-	-	Not used
TEST5[5]	CHP_DISABLE	0	-	1 : CHP up and down pulses disabled 0 : normal operation
TEST5[4]	VCO_OVERRIDE	0	-	1 : use VCO_AO[3:0] value 0 : use calibrated value
TEST5[3:0]	VCO_AO[3:0]	1000	-	VCO_ARRAY override value

**TEST4 Register (for test only, 42h)**

REGISTER	NAME	Default value	Active	Description
TEST4[7:6]	-	-	-	Not used
TEST4[5:0]	L2KIO[5:0]	100101	h	Constant setting charge pump current scaling/rounding factor. Sets Bandwidth of PLL. Use 3Fh for 38.4 and 76.8 kBaud

**TEST3 Register (for test only, 43h)**

REGISTER	NAME	Default value	Active	Description
TEST3[7:5]	-	-	-	Not used
TEST3[4]	BREAK_LOOP	0	-	1 : PLL loop open 0 : PLL loop closed
TEST3[3:0]	CAL_DAC_OPEN	0100	-	Calibration DAC override value, active when BREAK_LOOP =1

**TEST2 Register (for test only, 44h)**

REGISTER	NAME	Default value	Active	Description
TEST2[7:5]	-	-	-	Not used
TEST2[4:0]	CHP_CURRENT [4:0]	-	-	Status vector defining applied CHP_CURRENT value

**TEST1 Register (for test only, 45h)**

REGISTER	NAME	Default value	Active	Description
TEST1[7:4]	-	-	-	Not used
TEST1[3:0]	CAL_DAC[3:0]	-	-	Status vector defining applied Calibration DAC value

**TEST0 Register (for test only, 46h)**

REGISTER	NAME	Default value	Active	Description
TEST0[7:4]	-	-	-	Not used
TEST0[3:0]	VCO_ARRAY[3:0]	-	-	Status vector defining applied VCO_ARRAY value

## Package Description (TSSOP-24)

Note: The figure is an illustration only.

Thin Shrink Small Outline Package (TSSOP)											
		D	E1	E	A	A1	E	B	L	Copl.	$\alpha$
TSSOP 24	Min	7.7	4.30	6.40	1.20	0.15	0.65	0.30	0.75	0.10	8°
	Max	7.9	4.50								

All dimensions in mm

## Soldering Information

Recommended soldering profile is according to CECC 00 802, Edition 3

## Plastic Tube Specification

TSSOP 4.4mm (.173") antistatic tube.

Tube Specification				
Package	Tube Width	Tube Height	Tube Length	Units per Tube
TSSOP 24	268 mil	80 mil	20"	62

## Carrier Tape and Reel Specification

Carrier tape and reel is in accordance with EIA Specification 481.

Tape and Reel Specification					
Package	Tape Width	Component Pitch	Hole Pitch	Reel Diameter	Units per Reel
TSSOP 24	16 mm	8 mm	4 mm	13"	2500

## Ordering Information

Ordering part number	Description	MOQ
CC1050	Single Chip RF Transceiver	62 (tube)
CC1050/T&R	Single Chip RF Transceiver	2500 (tape and reel)
CC1050DK-433	CC1050 Development Kit, 433 MHz	1
CC1050DK-868	CC1050 Development Kit, 868/915 MHz	1
CC1050SK	CC1050 Sample Kit (5 pcs)	1

MOQ = Minimum Order Quantity
