

## 24-Bit, 96 kHz Stereo A/D Converter

### Features

- 24-bit conversion
- Supports 96 kHz sample rates
- 98 dB dynamic range at 3 V supply
- -88 dBFS THD+N
- 1.8 to 3.3 volt supply
- 16-Pin TSSOP package
- Low power consumption
  - 11 mW at 1.8 V
- Internal high pass filter to remove DC offsets
- Linear phase digital anti-alias filter

### Description

The CS5333 is a highly integrated, 24-bit, 96 kHz audio ADC providing stereo analog-to-digital converters using delta-sigma conversion techniques. This device includes line level inputs in a 16-pin TSSOP package.

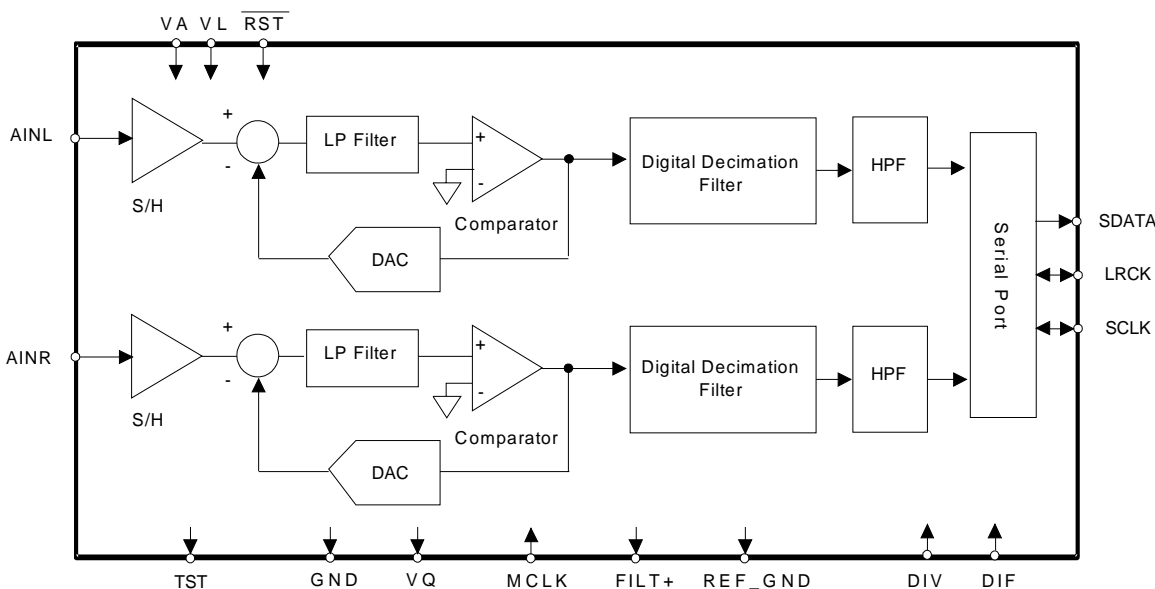

The CS5333 is based on delta-sigma modulation allowing infinite adjustment of the sample rate between 2 kHz and 100 kHz simply by changing the master clock frequency.

The CS5333 operates from a +1.8 V to +3.3 V supply. These features are ideal for set-top boxes, A/V receivers, DVD-karaoke players or any system which requires optimal performance in a minimum of space.

<b>Interface Power</b>	1	<b>VL (Input)</b> - Digital interface power supply. Typically 1.8 to 3.3 VDC.
<b>Master Clock</b>	2	<b>MCLK (Input)</b> - The master clock frequency must be either 256x, 384x, 512x, 768x or 1024x the input sample rate in Base Rate Mode (BRM) and 128x, 192x, 256x, 384x the input sample rate in High Rate Mode (HRM). Table 1 illustrates several standard audio sample rates and the required master clock frequencies.
<b>Serial Clock</b>	3	<b>SCLK (Input/Output)</b> - Clocks the individual bits of the serial data out of the SDOUT pin. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF pin.
<b>Serial Audio Data Out (M/S select)</b>	4	<b>SDATA (Output)</b> - This pin serves two functions. First: two's complement MSB-first serial data is output on this pin. The data is clocked out of SDOUT via the serial clock and the channel is determined by the Left/Right clock. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF pin. Second: Master/Slave mode selection is determined, at startup, by a 47 kOhm pullup/pulldown on this line. A pullup to VL selects Master mode and a pulldown to GND selects Slave mode.
<b>Analog Power</b>	5	<b>VA (Input)</b> - Analog power supply. Typically 1.8 to 3.3 VDC.
<b>Ground</b>	6	<b>GND (Input)</b> - Ground Reference.

**Table 1. Common Clock Frequencies**

Left/Right Clock	7	<b>LRCK</b> ( <i>Input/Output</i> ) - The Left/Right clock determines which channel is currently being output on the serial audio data line SDOUT. The frequency of the Left/Right clock must be at the input sample rate. The required relationship between the Left/Right clock, serial clock and serial data is defined by the DIF pin.						
MCLK Divide Enable	8	<b>DIV</b> ( <i>Input</i> ) - This pin serves different functions in Master and Slave modes. In Master mode: When high, the chip will enter High Rate Mode; When this pin is low, the chip will enter Base Rate Mode. In Slave mode: When high, MCLK is divided internally by 2; When low, MCLK is not changed.						
Digital Interface Format	9	<b>DIF</b> ( <i>Input</i> ) - The required relationship between the Left/Right clock, serial clock and serial data is defined by the Digital Interface Format. <table border="1"><thead><tr><th>DIF</th><th>DESCRIPTION</th></tr></thead><tbody><tr><td>0</td><td>I<sup>2</sup>S, up to 24-bit data</td></tr><tr><td>1</td><td>Left Justified, up to 24-bit data</td></tr></tbody></table>	DIF	DESCRIPTION	0	I <sup>2</sup> S, up to 24-bit data	1	Left Justified, up to 24-bit data

Table 2. Digital Interface Format - DIF								
Test Input	10	<b>TST</b> ( <i>Input</i> ) - Must be connected directly to ground.						
Positive Voltage Reference	11	<b>FILT+</b> ( <i>Output</i> ) - Positive reference for internal sampling circuits. An external capacitor is required from FILT+ to ground, as shown in Figure 3. The recommended value will typically provide 60 dB of PSRR at 1 kHz and 40 dB of PSRR at 60 Hz. FILT+ is not intended to supply external current. FILT+ has a typical source impedance of 250 kΩ and any current drawn from this pin will alter device performance.						
Reference Ground	12	<b>REF_GND</b> ( <i>Input</i> ) - Ground reference for the internal sampling circuits. Must be connected to ground.						
Analog Inputs	13,14	<b>AINR, AINL</b> ( <i>Input</i> ) - The full scale analog input level is specified in the Analog Characteristics specification table.						
Quiescent Voltage	15	<b>VQ</b> ( <i>Output</i> ) - Filter connection for internal A/D converter quiescent reference voltage. A capacitor must be connected from VQ to ground. VQ is not intended to supply external current. VQ has a typical source impedance of 250 kΩ and any current drawn from this pin will alter device performance.						
Reset	16	<b>RST</b> ( <i>Input</i> ) - When low the device enters a low power mode and the part is in reset. When high, the part returns to normal operation within 1024 LRCK cycles.						

## 4. APPLICATIONS

### 4.1 Grounding and Power Supply Decoupling

As with any high resolution converter, the CS5333 requires careful attention to power supply and grounding arrangements to optimize performance. Figure 3 show the recommended power arrangement with VA and VL connected to clean supplies. Decoupling capacitors should be located as close to the device package as possible.

### 4.2 Oversampling Modes

The CS5333 operates in one of two oversampling modes. Base Rate Mode supports input sample rates up to 50 kHz while High Rate Mode supports input sample rates up to 100 kHz. See Table 1 for more details.

### 4.3 Recommended Power-up Sequence

- 1) Hold  $\overline{\text{RST}}$  low until the power supply, master, and left/right clocks are stable. In this state, VQ will remain low.
- 2) Bring  $\overline{\text{RST}}$  high. The device will remain in a low power state with VQ low and will initiate

the power-up sequence. This power-up sequence takes approximately 1024 LRCK cycles to complete.

### 4.4 Master/Slave Mode

In Master, Base Rate Mode (Pull-up on SDATA, DIV=0), the CS5333 requires a 256x MCLK and provide a 64x SCLK. In Master, High Rate Mode (Pull-up on SDATA, DIV=1), the CS5333 requires a 128x MCLK and provide a 64x SCLK. The various clocking ratios required in Slave Mode (Pull-down on SDATA) are listed under the description of MCLK, on page 11.

## **5. PARAMETER DEFINITIONS**

### **Total Harmonic Distortion + Noise (THD+N)**

The ratio of the rms value of the signal to the rms sum of all other spectral components over the specified bandwidth (typically 10 Hz to 20 kHz), including distortion components. Expressed in decibels.

### **Dynamic Range**

The ratio of the full scale rms value of the signal to the rms sum of all other spectral components over the specified bandwidth. Dynamic range is a signal-to-noise measurement over the specified bandwidth made with a -60 dBFS signal. 60 dB is then added to the resulting measurement to refer the measurement to full scale. This technique ensures that the distortion components are below the noise level and do not effect the measurement. This measurement technique has been accepted by the Audio Engineering Society, AES17-1991, and the Electronic Industries Association of Japan, EIAJ CP-307.

### **Interchannel Isolation**

A measure of crosstalk between the left and right channels. Measured for each channel at the converter's output with all zeros to the input under test and a full-scale signal applied to the other channel. Units in decibels.

### **Interchannel Gain Mismatch**

The gain difference between left and right channels. Units in decibels.

### **Gain Error**

The deviation from the nominal full scale analog output for a full scale digital input.

### **Gain Drift**

The change in gain value with temperature. Units in ppm/°C.
