

DVD On-a-Chip Solution

Features

- Powerful Dual 32-bit RISCs >160 MIPS
- Software based on popular RTOS, C/C++
- MPEG video decoder supports DVD, VCD, VCD 3.0, and SVCD standards
- Video input with Picture-in-Picture and zoom
- 8-bit multi-region OSD w/vertical flicker filter
- Universal subpicture unit for DVD and SVCD
- PAL<->NTSC Scaling and Transcoding
- Supports SDRAM and FLASH memories
- Powerful 32-bit Audio DSP >80 MIPS
- Decodes: AC-3, DTS, MPEG Stereo
- Plays MP3 CDs
- Karaoke echo mix and pitch shift
- Optional 3-D Virtual, bass & treble control
- Up to 8-channel PCM output
- IEC-60958/61937 Out: AC-3, DTS, MPEG
- Multi-Mode Serial Audio I/O: I2S & AC-Link
- AV Bus or ATAPI interface or DVD/CD/HD
- GPIO support for all common sub-circuits

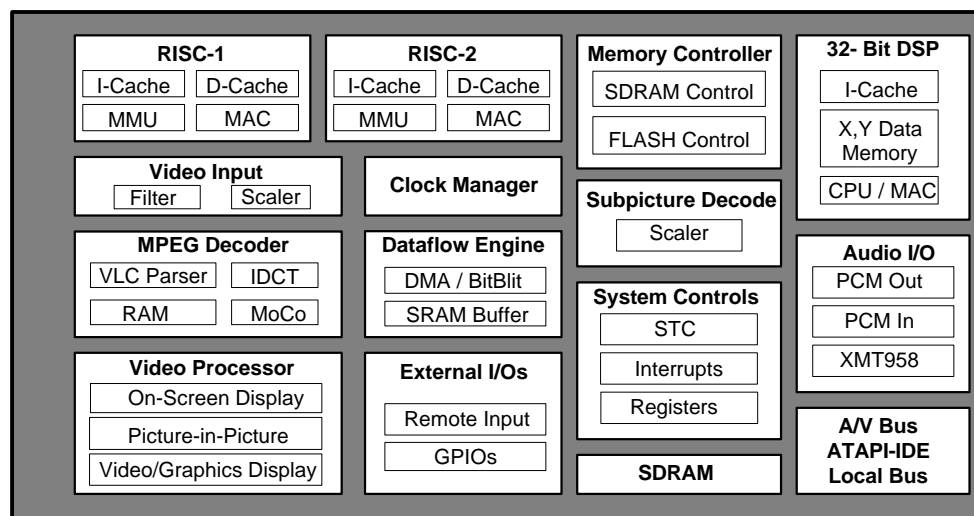

Description

Overall the CS98000 Crystal DVD Processor is targeted as a market specific consumer entertainment processor that empowers new product classes with the inclusion of a DVD player as a fundamental feature. You can use this integrated circuit with all the other Crystal mixed signal data converters, DSPs, and the CS98000's high quality factory firmware to rapidly conceptualize, design, and market cutting-edge Internet age products such as:

- DVD A/V Mini-Systems
- DVD Players
- DVD Receivers
- Car/SUV Entertainment Units

ORDERING INFORMATION

CS98000-CM 0° to 70° C 208-pin

Preliminary Product Information

1. CHARACTERISTICS AND SPECIFICATIONS

1.1 AC AND DC PARAMETRIC SPECIFICATIONS

(AGND, DGND=0V, all voltages with respect to 0V)

1.1.1 ABSOLUTE MAXIMUM RATING

Symbol	Description	Min	Max	Unit
VDD _{IO}	Power Supply Voltage on I/O ring	-0,5	4.6	Volts
VDD _{CORE}	Power Supply Voltage on core logic and PLL	-0.5	3.6	Volts
V _I	Digital Input Applied Voltage (power applied)	-0.5	5.5	Volts
I _I	Digital Input Forced Current	-10	10	mA
I _O	Digital Output Forced Current	-50	50	mA
T _{SOL}	Lead Soldering Temperature	-	260	°C
T _{VSOL}	Vapor Phase Soldering Temperature	-	220	°C
T _{STOR}	Storage Temperature (no power applied)	-40	125	°C
T _{AMB}	Ambient Temperature (power applied)	0	70	°C
P _{IO}	Power consumption on I/O ring (C _L = 35 pF)	-	57	mA
P _{CORE}	Power consumption on the core logic	-	620	mA
P _{PLL}	Power consumption on the PLL logic	-	15	mA

CAUTION: Operating beyond these Minimum and Maximum limits can result in permanent damage to the device. Cirrus Logic recommends that CS98000 devices operate at the settings described in the next table.

1.1.2 RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Units
Supply Voltage, IO	V _{DD}	3.0	3.3	3.6	Volts
Supply Voltage, core and PLL	V _{DD}	2.25	2.5	2.75	Volts
Ambient Temperature(power applied)	T _{AMB}	0	25	70	°C

1.1.3 ELECTRICAL CHARACTERISTICS

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Supply Current, IO	I_{DD}	Normal Operating	-	45	-	mA
Supply Current, core and PLL	I_{DD}	Normal Operating	-	550	-	mA
Input Voltage, High	V_{IH}		2.0	-	5.0	Volts
Input Voltage, Low	V_{IL}		-	-	0.8	Volts
Input Current	I_{IN}	$V_{IN} = V_{DD}$ or V_{SS}	-1	-	+1	μA
Input Pull up/down resistor	R_I		-	75	-	K Ω
Output Voltage, High	V_{OH}	@ buffer rating	2.4	-	-	Volts
Output Voltage, Low	V_{OL}	@ buffer rating	-	-	0.4	Volts
Three-state Leakage	I_{OZ}	$V_{OUT} = V_{SS}$ or V_{DD}	-10	-	+10	μA
Input Capacitance	C_{IN}		-	3	-	pF
Output Capacitance	C_{OUT}		3		6	pF
Bidirect Capacitance	C_{BID}		3		6	pF

1.2 DC CHARACTERISTICS

($T_A = 25^\circ\text{C}$; $V_{DD_PLL} = V_{DD_CORE} = 2.5\text{V} \pm 10\%$, $V_{DD_IO} = 3.3\text{V} \pm 10\%$)

1.2.1 ATAPI Interface

CS98000 can interface with a ATAPI-type slave loader gluelessly. Figure 1 illustrates a read ATAPI transaction and a write ATAPI transaction. PIO mode 4 is implemented to enable a sufficient data transfer rate between ATAPI device and CS98000.

Note: ATAPI interface is a standard administered by the T13 committee that is responsible for all interface standards relating to the AT Attachment (ATA) storage interface. T13 is a technical committee for the National Committee on Information Technology Standards (NCITS). See <http://www.t13.org/>.

Symbol	Description	Min	Typ	Max	Unit

1.2.2 SDRAM Interface

CS98000 interfaces with either SDRAM or SGRAM for high data bandwidth transfer. [Figure 2](#) shows the refresh cycle performed by CS98000. [Figure 3](#) shows a burst write (length = 8) transaction. [Figure 4 on page 9](#) shows a burst read (length = 8) transaction, while [Figure 5 on page 9](#) shows detailed SDRAM interface timing. In both [Figure 3](#) and [Figure 4](#), CAS latency is programmed to 3.

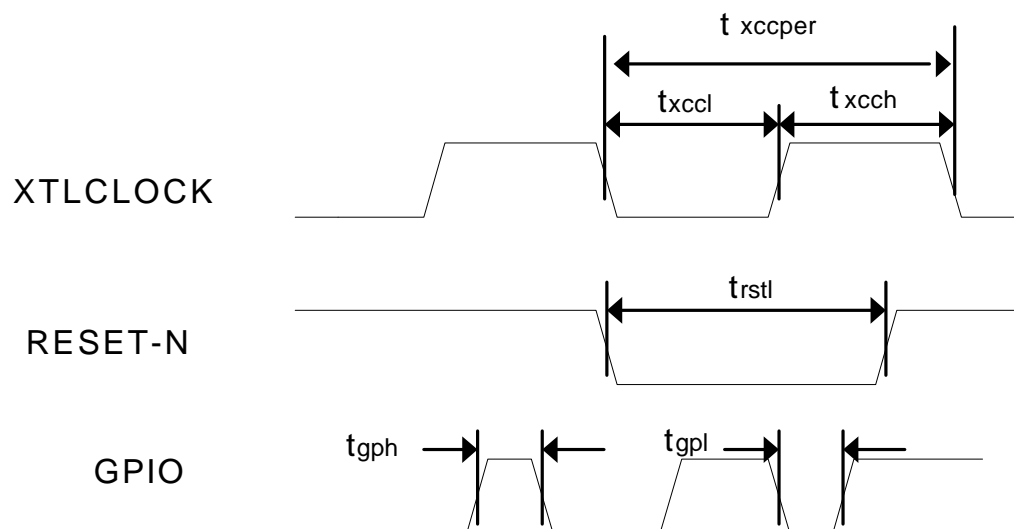

Figure 12. Miscellaneous Timing

2. TYPICAL APPLICATION

The [Figure 13](#) shows a typical example of a complete Internet-DVD solution using the CS98000.

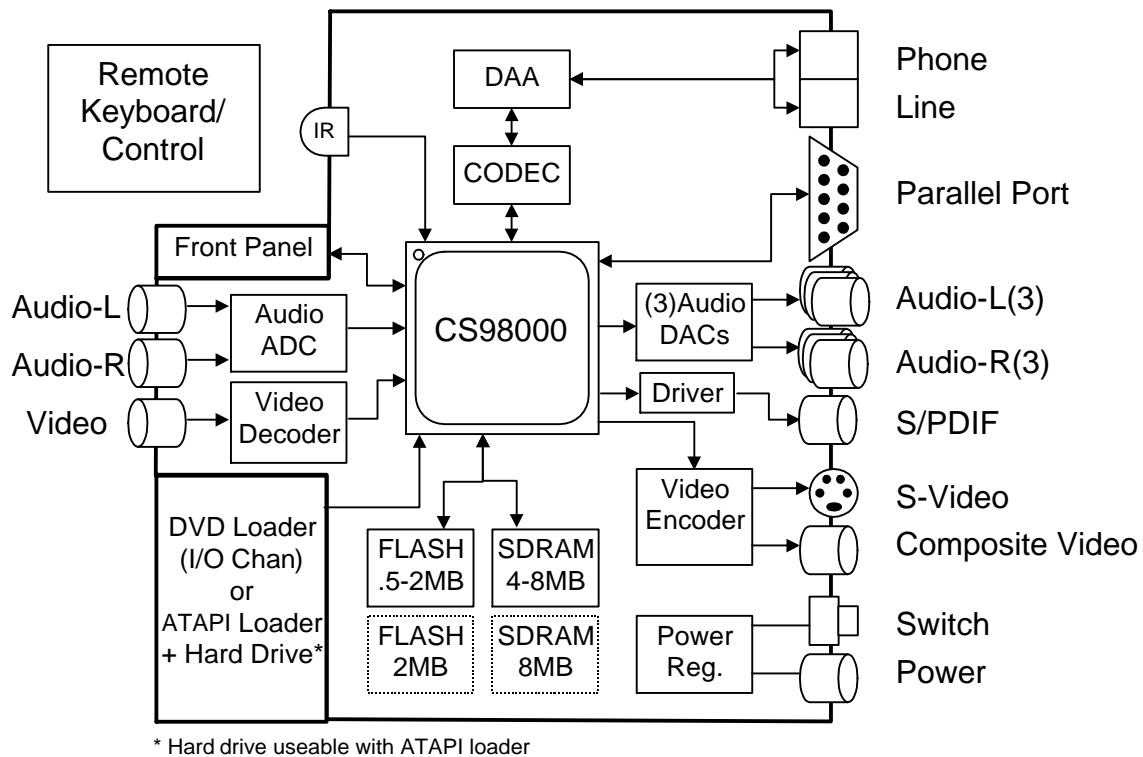

Figure 13. CS98000 Typical Application

3. FUNCTIONAL DESCRIPTION

3.1 Block Diagram

The CS98000 block diagram is shown in [Figure 14](#).

3.2 CS98000 Device Details

3.2.1 RISC-32 Processors

- Two Powerful 32-bit RISC processors (RISC0 and RISC1)
- Virtual memory support
- Optimizing C compiler
- Big or little endian data formats support
- MAC multiply/accumulate in 2 cycles with C support
- 4 Kbyte instruction cache, 2 Kbyte data cache
- Single cycle instructions, runs at 81 Mhz

3.2.2 Powerful 24/32-Bit DSP

- Powerful 24/32 bit DSP processor, programmable through CS98000 API, See *CS98000 Software API, (DS525UM1)*
- 24-bit fixed point logic, with 54-bit accumulator
- Single-cycle throughput, 2-cycle latency multiply accumulate, 32-bit simple integer logic. 8-Kbyte instruction cache, 8-Kbyte program visible local memory
- Single cycle instructions, runs at 81 Mhz

3.2.3 System Controls

- Includes several hardware lockable semaphore registers
- General-purpose register for inter-processor communication
- 32-bit timers for I/O and other uses, with programmable interval rates

Figure 14. CS98000 Block Diagram

- Both hardware and software interrupts on data or debug
- Built in PLLs generate all required clocks from 27 Mhz input clock

3.2.4 Memory Controller

- Supports SDRAM, and SGRAM, from 2 Mbytes to 32 Mbytes
- Supports multiple banks of FLASH and ROM up to 16 Mbytes
- 32-bit data bus for DRAM, 8 or 16-bit data bus for ROM

3.2.5 Data Flow Engine

- 2432 bytes of internal memory
- DMA to/from main RAM into local SRAM
- Supports endian conversion and byte, short, long data formats on DMA
- Supports block transfers for graphics bit blits

3.2.6 MPEG Video Decoder

- Supports VCD, VCD 3.0, SVCD, DVD video standards
- Supports trick features, including smooth 2x play and reverse play
- Special anti-tearing logic controls picture decode and presentation
- Advanced error concealment hardware

3.2.7 System Synchronization

- System time clock (STC) for audio/video synchronization
- Flexible interrupt structure for controlling decode and presentation times
- Hardware scheduling of subpicture and highlight events

3.2.8 Audio Interface

- Supports PCM, I²S and IEC-958 outputs at up to 96 KHz output rate
- 8 output channels, 2 input channels

3.2.9 Video Input

- NTSC/PAL video decoder input interface
- Built in variable down scaling, handles CCIR 601 to QCIF input formats
- Video input image can be displayed in small window, or as main picture

3.2.10 External Interface

- Serial I²C® master and slave port

- 29 independent fully programmable bi-directional I/O pins
- 8 edge or level detection interrupt pins
- Hardware assisted support for infrared remote devices, such as remote control, infrared keyboard, mouse, printer, and more
- Programmable parallel host master and slave interface supports many formats including ATAPI, ISA, and more
- IO channel interface supports standard DVD loader protocols
- Serial interface supports AC-97 and other standard MODEM CODEC protocols

3.2.11 Video Processor

- Supports 24-bit 4:2:0 and 4:2:2 video modes and 16-bit true color graphics modes.
- On screen display module supports 2-bit, 4-bit, or 8-bit pixel modes, while supporting 3 separate regions and 16 transparency overlay levels
- Picture-in-picture module includes horizontal and vertical downscaling with programmable output sizes, positions, and borders
- Overlay mixer with RGB to YUV conversion and output formatting
- Supports 4:2:0, 4:2:2, YUV655, RGB565 and RGB555 frame buffer inputs
- Outputs 4:2:2 video in CCIR-601 or CCIR-656 format
- High quality scaling using a vertical and a horizontal 16 taps polyphase programmable filter and supports any size image up to 768x576
- Programmable sharpening and de-blocking filters
- 5 taps programmable adaptative anti-flicker filtering for graphics source
- Master or Slave video sync configuration
- Multiple video plains overlay (main video / video input / picture_in_picture / picture/on_screen / display/cursor)
- Gamma correction

3.2.12 Sub-Picture Processor

- Run-length decode DVD sub-pictures and SVCD OGT formats
- Hardware vertical scaling supports NTSC-PAL format conversion
- 16-level alpha blending
- Provides hardware cursor mode for non-DVD applications

3.2.13 System Functions

- 208-pin PQFP packages
- All I/O pins are 3 V with 5 V tolerance
- Advanced 0.25 micron CMOS technology
- Internal processors run at 81 MHz
- Supports Low Power modes and clock shutoff

3.3 RISC Processor

The CS98000 includes two powerful, proprietary 32-bit RISC processors, RISC0 and RISC1, with optimizing C compiler support and source level debugger. The RISC processors fully support many Real Time Operation Systems (RTOS). The DVD application user interface resides on RISC1 and is customer programmable. The real time control of low level DVD functions is performed by RISC0. RISC1 gains access to system resources controlled by RISC0 via calls through an Applications Programming Interface, (see the CS98000 Software API). All RISC0 firmware, API and sample application code are supplied with the CS98000.

The RISC processors also have a MAC engine, which performs multiply/accumulate in 2 cycles in a pipelined fashion with C support, effectively achieving single cycle throughput. The RISC0 processor coordinates on-chip multi-threaded tasks, as well as system activities such as remote control and front panel control. The DVD application end-user interface resides on RISC1, and any modifications to that interface occur through the CS98000 API.

3.4 DSP Processor

The CS98000 contains a proprietary digital signal processor (DSP), which is optimized for audio applications. The DSP performs 32-bit simple integer operations, and has a 24-bit fixed point logic unit, with a 54-bit accumulator. There are 32 general-purpose registers, and eight independent address generation registers, featuring: linear and circular buffer operations, and dual operand read from memory. The multiply-accumulator has single-cycle throughput, with two cycle latency. The DSP is optimized for bit packing and unpacking opera-

tions. The interface to main memory is designed for handling flexible block sizes and skip counts.

3.5 Memory Control

The DRAM Interface performs the SDRAM control and arbitration functions for all the other modules in the CS98000. The DRAM interface services and arbitrates a number of clients and stores their code and/or data within the local memory. This arbitration and scheduling guarantees the allocation of sufficient bandwidth to the various clients. The DRAM Interface supports up to 32 Mbytes. For a typical DVD player application, CS98000 requires 8 Mbytes memory space.

Sharing the same interface, CS98000 also supports FLASH ROM, OTP, or mask ROM interface. Code is stored in ROM. After the system is booted, the code is shadowed inside SDRAM for execution. The FLASH ROM interface is provided so that the code can be upgraded in the field once the communications channel is established (via modem port, CD-R, or serial port). Utility software will be provided to debug and upgrade code for the system manufacturer.

3.6 Dataflow Control (DMA)

The DMA controller moves data between the external memory and internal memory. The external memory address can be specified using a register, or in FIFO mode, using start and end address registers. Separate start/end address registers are used for DMA read and write operations. The DMA interface also has a block transfer function, which allows for the transfer of one block of data from one external memory location to another external memory location. In effect, this feature combines a DMA read and write into one operation. In addition, the DMA write operation allows for byte, short, word, and other types of masking.

3.7 System Control Functions

The system control functions are used to coordinate the activities of the multiple processors, and to pro-

vide the supporting system operations. Four 32-bit communication registers are available for inter-processor communication, and eight semaphore registers are used for resource locking. Timers are available for general-purpose functions, as well as more specialized functions such as watchdog timers and performance monitoring.

The large number of general purpose I/Os offers flexibility in system configurations. An I²C master allows for control of other I²C devices, such as a video encoder. An I²C slave port shares the same pins, and can be used for debug functions. Interrupts can be generated on specific or generic events. Infrared inputs can be filtered to make them free of glitches or stored unfiltered into memory. Control of all the internal clocks is also possible. Internal PLLs are used to generate the internal system and memory clocks and audio clocks of any widely used frequency.

3.8 DVD/ATAPI Interface

The CS98000 has a programmable interface port which can be configured to connect to industry standard CD/DVD loaders without external glue logic. The CD/DVD interface fully supports many popular CD/DVD loaders. The interface consists of DVD control and data ports and an optional CD control/data port.

The CS98000 hardware manages the DVD interface and moving data to an arbitrary size input FIFO in DRAM. The same interface pins can be optionally configured as a generic 16-bit host master port. In this mode, the CS98000 can control up to four devices (using 4 chip select outputs), each of which may use different protocol and timing. The interface can be set up in ATAPI mode, to connect directly to any

ATAPI DVD loader (using two chip selects). Simultaneously, the other two chip selects can be configured to connect to other devices, such as a super I/O chip or hard disk.

A third option is to configure the interface for micro-less DVD loader operation, which may also be configured to connect without external glue logic.

3.9 MPEG Video Decoding

Compressed MPEG data is read from the DVD disk into an input FIFO in DRAM. The data flow (DMA) controller moves Video packets from the input FIFO into the MPEG decoder's input FIFO (also in DRAM). The DMA controller can also perform advanced functions such as start code search, relieving the RISC processors. The System Synchronization function is used to control the timing of MPEG picture decoding. The MPEG Video decoder processes I, B, and P frames, and writes to video frame buffers in DRAM for output to the display. Special anti-tearing logic ensures that currently displayed frame buffers are not overwritten.

3.10 Audio Processing

Compressed Audio data is read from the DVD disk into an input FIFO in DRAM. The data is decompressed, then written to a PCM output FIFO, also in DRAM. Presentation time stamps (PTS) are extracted from the stream to update the STC, in order to maintain audio/video synchronization.

The DMA and decompression stages of audio processing can be done with a combination of the DMA unit, DSP, and RISC processors. The DSP is optimized for audio processing, so most common formats can be handled by the DSP alone, including AC-3, DTS, MPEG2 audio, and MP3. The DSP has enough reserve bandwidth to handle the Karaoke echo-mix and pitch shift, and AC-3 down-mix functions.

The audio output data is written into a DRAM FIFO in 16-, 18-, 20- or 24-bit PCM format. A flexible audio output stage can simultaneously output 8 channels of PCM data to audio DACs, or 6 channels of audio data plus an IEC-958 encoded output, at up to 96 KHz. The audio interface also includes a flexible PCM input interface, which can input a

wide range of protocols from an audio ADC or an IEC-958 receiver.

3.11 Soft Modem

The soft modem processing is handled by one of the RISC processors, which is typically dedicated for that function. Data rates up to 56 Kbits (V.90 protocol) are supported. The CS98000 interfaces to a simple external CODEC/DAA circuit using a flexible serial interface. The serial interface is a fully programmable, bi-directional interface and can be used either as a PCM interface or as an AC97 interface. In PCM mode, the sample size could be adjusted to 20, 18 or 16 bits to match common DAC and ADC formats, or any other specific size. In AC97 mode, any slot can be used to interface either a modem CODEC or an audio CODEC.

3.12 Video

The Digital Video Interface provides flexible and powerful means of outputting digital video data to external devices in CCIR601/3 and CCIR656 formats. The interface directly supports NTSC/PAL video encoding, in both master and slave synchronization configurations. The internal frame buffer format could be 4:2:0, 4:2:2, YUV655, RGB565 and RGB555. Cirrus Logic provides some easy-to-use utilities in order to get the best advantage of the powerful video filtering capabilities of the CS98000. The CS98000 also features an NTSC/PAL video decoder input interface. The interface accepts CCIR601, CIF, and QCIF formats, out of many TV decoders on the market. The video processor also allows overlay of multiple video planes (main video / video input / picture_in_picture / on_screen display / cursor). CS98000 has been proven to work with many TV encoders on the market with brands such as: Crystal, Brooktree, ADI, and AVS.

The Video Input Scaler (VIS) module inputs 8-bit digital video data from a camera or PAL/NTSC decoder, optionally down-scales to SIF or QSIF, and stores the data in one to three DRAM frame buffers. The scaled image, with a border, can be overlaid anywhere on the screen into a 1/2 or 1/4-screen sized window by the Picture in Picture (PIP) module.

An alternate method of using the Video Input function is to input a full sized picture and present it on the screen full size (bypass mode). In this mode, the PIP module can place full motion DVD images in the small window. An internal glitch-free mux can switch the video processor clock source from the internal clock to the Video Input clock, allowing the PIP mode to switch back and forth on the fly, with no dropout.

4. MEMORY MAP

4.1 Processor Memory Map

The CS98000 externally supports up to 32 Mbytes DRAM and 16 Mbytes ROM/NVRAM. [Table 10](#), [Table 11](#) and [Table 12](#) on the next page list the memory map as viewed by the RISC processors, and identifies whether each segment is mapped or cacheable.

For detailed information on programming CS98000 memory, see *CS98000 Memory Interface User's Manual* (DS525UMD1).

4.2 Host Port Memory Map

[Table 11](#) on [page 23](#) lists the memory map as viewed by host slave port.

4.3 Internal I/O Space Map

[Table 10](#), [Table 11](#), and [Table 12](#) show how the Internal I/O space is mapped between general registers, internal SRAM ports, and the RISC processors' debug port.

Processor Byte Address	Description	Cacheable
------------------------	-------------	-----------

Table 10. Memory Map-RISC0 Processor

0000_0000 – 07FF_FFFF	DRAM (mapped)	Y
8000_0000 - 81FF_FFFF	DRAM (32 Mbytes)	Y
9400_0000 – 9CFF_FFFF	16-bit NVRAM write (16 Mbytes)	N
9C00_0000 – 9CFF_FFFF	16-bit NVRAM/ROM (16 Mbytes)	Y
9D00_0000 – 9DFF_FFFF	8-bit NVRAM/ROM (16 Mbytes)	Y
A000_0000 – A1FF_FFFF	DRAM (32 Mbytes)	N
B000_0000 – B003_FFFF	Internal I/O (256 Kbytes)	N
B400_0000 – BCFF_FFFF	16-bit NVRAM write (16 Mbytes)	N
BC00_0000 – BCFF_FFFF	16-bit NVRAM/ROM (16 Mbytes)	N
BD00_0000 – BDFF_FFFF	8-bit NVRAM/ROM (16 Mbytes)	N
C000_0000 – FFFF_FFFF	DRAM (mapped)	Y

Table 10. Memory Map-RISC0 Processor

Host Byte Address	Description
0000 0000 – 003F FFFF	Internal I/O Space
1000 0000 – 13FF FFFF	DRAM space (16 Mbytes)
1400 0000 – 17FF FFFF	NVRAM space (16 Mbytes)

Table 11. Host Port Memory Map

Byte Address Offset	Description
0_0000 – 0_2FFF	General registers
0_3000 – 1_FFFF	General Internal SRAM
2_0000 – 2_FFFF	RISC_0 Internal SRAM/Registers
3_0000 – 3_FFFF	RISC_1 Internal SRAM/Registers

Table 12. Internal I/O Space Map

5. REGISTER DESCRIPTION

5.1 CS98000 Register Space

Table 13 lists the register groups, and how they are split among the main CS98000 functional blocks.

Table 14 lists all the registers for the CS98000 and

their addresses, and indicates whether the registers are read/write (R/W), read only (RO), or write only (WO).

CS98000 Register	Block
000xx, 010xx	General
001xx	Host
002xx	DRC
003xx	DMA
004xx	DVD Interface
005xx	Serial Interface
006xx	DSP
007xx	Synchronization Control
008xx	MPEG Video Decoder
009xx	Video Input Scaler
00Axx	Picture-in-picture
00Bxx	Video Processor
00Cxx	Subpicture Display
00Dxx	On-screen Display
00Exx	PCM In/Out
02xxxx	RISC_0
03xxxx	RISC_1

6. PIN DESCRIPTION

Figure 15. CS98000 Pinouts

Table 15 lists the conventions used to identify the pin type and direction.

Pin Type	Direction
I	Input
IS	Input, with schmitt trigger
ID	Input, with pull down resistor
IU	Input, with pull up resistor
O	Output
O4	Output – 4 mA drive
O8	Output – 8 mA drive
T4	Three-Stateable Output – 4mA drive
B	Bi-direction
B4	Bi-direction – 4 mA drive
B4U	Bi-direction – 4 mA drive, with pull-up
B8U	Bi-direction – 8 mA drive, with pull-up
B4S	Bi-direction – 4 mA drive, with schmitt trigger
B4SU	Bi-direction – 4 mA drive, with pull-up and Schmitt trigger
Pwr	+2.5 V or +3.3 V power supply voltage
Gnd	Power supply ground
Name_N	Low active

Table 15. Pin Type Legend

6.1 Pin Assignments

Table 16 lists the pin number, pin name, and pin type for the 208 pin CS98000 package. The primary function and pin direction is shown for all signal pins. For some signal pins, a secondary function

and direction are also shown. For pins having more than one function, the primary function is chosen when the chip is reset.

Pin	Name	Type	Primary Function	Dir	Secondary Function	Dir	Note
1	VDD_PLL	Pwr	PLL Power 2.5V	I			
2	M_A_11	O8	SDRAM Address[11]	O	ROM/NVRAM Address[11]	O

Table 16. 208-Pin Package Assignments (Continued)

- Notes: 1. Pin may be used for micro-less DVD loader interface
2. H_D(15:8) pins may be reassigned as GenIOHst(7:0)

6.2 Miscellaneous Interface Pins

These pins are used for used for basic functions such as clock and reset input. See [Table 17](#). The I²C pins are used for both master and slave mode (8-bit slave address is 0x30 for write, and 0x31 for read).

6.3 SDRAM Interface

These pins are used to interface the CS98000 with some external SDRAM. The CS98000 can interface with SDRAM of various sizes. Both 16 and 32-bit data width is supported, but best performance is achieved with 32 bits. Follow the instructions in [Table 18](#) on how to interface with any particular configuration of SDRAM.

Pin	Signal Name	Type	Description
186	SCL	B	I ² C Clock
187	SDA	B	I ² C Data
201	IR_IN	I	Infrared Input, from IR receiver.
202	XTLCLOCK	I	27 MHz Clock Input.
205	RESET_N	I	Reset Input, active low.
206	MFG_TEST	I	Manufacturing test pin, should always connect to ground.

Table 17. Miscellaneous Interface Pins

Pin	Signal Name	Type	Description
87, 83, 79, 76, 74, 71, 68, 64, 67, 70, 72, 75, 78, 80, 86, 88, 60, 56, 54, 49, 46, 44, 40, 33, 37, 42, 45, 48, 51, 55, 59, 62	M_D[31..0]	B	Memory Data Bus. CS98000 can use all 32 bits or can use only M_D[15..0], in which case M_D[31..16] can be left un-connected.
2, 3, 5, 6, 7, 9, 10, 11, 13, 14, 15, 16	M_A[11..0]	O	Memory Address Bus. Connect in order starting with M_A[0] to all RAM address pins not already connected to M_BS_L or M_AP. Unused upper M_A pins unconnected.
19	M_CKO	O	Memory Clock
22	M_CKE	O	Memory Clock Enable
21	M_BS_N	O	Bank Selection. Always connect to RAM BS or BS0 pin.
23	M_AP	O	Memory Auto Pre-charge. Always connect to RAM AP pin.
24	M_RAS_N	O	Memory Row Address Strobe
25	M_CAS_N	O	Memory Column Address Strobe
27	M_WE_N	O	Memory Write Enable
32, 31, 29, 28	M_DQM[3..0]	O	IO Mask of Data Bus M_DQM[3] -> M_D[31:24]

Table 18. SDRAM Interface

6.4 ROM/NVRAM Interface

This is the interface to the non-volatile memory that contains the firmware. See [Table 19](#). It could be either ROM, NVRAM – FLASH, or EEPROM, or any combination of these types of memory. This interface can also connect to SRAM that would emulate a ROM on a development system. The bus width is 8 or 16 bits. Except for the NVM_WE_N and NVM_OE_N pins, all these pins are shared with the DRAM interface, which operates simultaneously with the ROM/NVRAM interface.

6.5 Video Output Interface

This is the interface to a video encoder chip that will send the CS98000 video signals to a TV. See [Figure 20](#). The output format is either CCIR-601 or CCIR-656. The CS98000 supports both master and slave configuration. For CCIR-656 mode, the CS98000 must be the sync master. In this case, the HSYNC and VSYNC pins can be redefined as GPIOs

Pin	Signal Name	Type	Description
60, 56, 54, 49, 46, 44, 40, 33, 37, 42, 45, 48, 51, 55, 59, 62	M_D[15..0]	B	Memory Data Bus. Use M_D[7:0] for 8-bit interface
2, 3, 5, 6, 7, 9, 10, 11, 13, 14, 15, 16	M_A[11..0]	O	Memory Address Bus[11..0]
74, 71, 68, 64, 67, 70, 72, 75, 78, 80, 86, 88	M_D[27..16]	O	Memory Address Bus[23..12] For 16-bit data mode, M_D[26:16] is upper word address. For 8-bit data mode, M_D[27:16] is upper byte address.
83	M_D[30]	O	Address decode low. Copy of address MSB.
87	M_D[31]	O	Address decode high. Compliment of address MSB.
60	NVM_WE_N	O	NVRAM Write Enable.
62	NVM_OE_N	O	ROM/NVRAM Output Enable.

Table 19. ROM/NVRAM Interface

Pin	Signal Name	Type	Description
154	CLK27_O	O	27 Mhz Clock Output.
159	HSYNC	B	Horizontal Sync. Output when the CS98000 is the video master, input when the video encoder is master.
162	VSYNC	B	Vertical Sync. Output when the CS98000 is the video master, input when the video encoder is master.
173, 172, 170, 169, 167, 166, 165, 163	VDAT[7..0]	O	Video Data Output[7..0] in Cb,Y,Cr,Y format.

Table 20. Video Output Interface

6.6 Video Input Interface

The CS98000 supports CCIR-601, CIF, and QCIF video input format through this interface. See [Table 21](#).

6.7 Audio Output/Input Interface

This is the audio PCM interface that connects to an audio CODEC. See [Table 22](#). The sample rate and the size of the samples are programmable for both input and output direction.

Pin	Signal Name	Type	Description
145	VIN_CLK	I	Video Input Clock.
153	VIN_VSNC	I	Video Input Vertical Sync.
160	VIN_HSNC	I	Video Input Horizontal Sync.
207	VIN_FLD	I	Video Input Field.
198, 193, 189, 184, 179, 175, 168, 164	VIN_D [7..0]	I	Video Data Input[7..0] in Cb,Y,Cr,Y format.

Table 21. Video Input Interface

Pin	Signal Name	Type	Description
191	AUD_XCLK	B	Audio 256x/384x Clock input or output to Serial DAC. When output, is generated from CS98000 internal PLL.
124	AUD_BCK	O	Audio Bit Clock output to serial DAC.
128	AUD_LRCK	O	Audio Out Left/Right Clock to serial DAC.
135	AUD_DO_0	O	Audio Serial Data Out[0].
136	AUD_DO_1	O	Audio Serial Data Out[1].
133	AUD_DO_2	O	Audio Serial Data Out[2].
177	AUD_DO_3	O	Audio Serial Data Out[3].
204	SPDIF_O	O	S/PDIF Output
137	AIN_BCK	I	Audio Input Bit Clock. The CS98000 can be programmed to use the Audio Output function's internally generated bit clock, in which case this pin is not required.
139	AIN_LRCK	I	Audio Input Left/Right Clock. The CS98000 can be programmed to use the Audio Output function's internally generated LR clock, in which case this pin is not required.
140	AIN_DATA	I	Audio Input Data from Serial ADC.

Table 22. Audio Input/Output Interface

6.8 AC97/CODEC Interface

This serial interface could be used either as a second PCM CODEC interface or as an AC97 serial link to an AC97 compliant CODEC. This interface could control a modem, or a second set of audio channels. [Table 23](#) describes the pin to signal assignments for the AC97/CODEC Interface.

6.9 Host Master/ATAPI Interface

This 16-bit parallel host interface allows the CS98000 to be a host master, controlling other devices that would be used on the same system. See [Table 24](#). The interface supports programmable protocols and speeds, including multiplexed and non-multiplexed addressing. Slaves with different protocols can be connected at the same time, controlled by different chip selects.

Pin	Signal Name	Type	Description
142	CDC_DI	I	Serial Data Input from Modem CODEC
144	CDC_DO	O	Serial Data Output to Modem CODEC
146	CDC_RST	O	Reset Output to Modem CODEC
147	CDC_CK	I	Serial Bit Clock input from Modem CODEC
148	CDC_SY	B	Frame Sync, output when CS98000 is master, input when CODEC is master.

Table 23. AC97/CODEC Interface

Pin	Signal Name	Type	Description
111, 115, 101, 106	H_CS[3..0]	O	Host Chip Select[3..0]. The host master can be programmed to use a different protocol for each of the 4 chip selects
85	H_ALE	O	Host address latch enable. Used for modes which multiplex upper address information onto the data lines
92	H_RD	O	Host Read Request.
93	H_WR	O	Host Write Request.
95	H_RDY	I	Host Ready. Connect to pull-up or pull-down if host is not used.
120	H_CKO	O	Host clock out, required for some synchronous slaves
102, 107, 97, 99, 100	H_A[4..0]	O	Host Address[4..0].
109, 110, 112, 113, 114, 116, 117, 118, 121, 122, 123, 125, 127, 130, 132, 134	H_D[15..0]	B	Host Data Bus[15..0]. These pins can also output Host Address during the address phase for multiplexed address/data mode. Tie together to pull-up or pull-down if host is not used.

Table 24. Host Master/ATAPI Interface

6.10 DVD I/O Channel Interface

This interface connects to standard DVD loaders, and consists of three parts: Control, DVD Data and CD Data. (See [Table 25](#).) This interface shares CS98000 pins with the Host Master/ATAPI interface. (See [Table 24 on page 43](#).) The definition of the pins is set via register programming, and the two modes are mutually exclusive.

6.11 General Purpose Input/Output (GPIO)

The CS98000 provides 37 GPIO pins, each with individual output three-state controls. Three-state means that the output driver is turned off or placed in the high-impedance state. [Table 26](#) describes the General Purpose I/O Interface. Additional pins may also be re-defined as GPIO's.

Pin	Signal Name	Type	Description
121, 122, 123, 125, 127, 130, 132, 134	H_D[7:0]	I	DVD_Data[7:0] – DVD data port parallel data input from loader
118	H_D[8]	O	Control port clock to loader
117	H_D[9]	I	Control port ready signal from loader
116	H_D[10]	O	Control port serial command to loader
114	H_D[11]	I	Control port serial status from loader
113	H_D[12]	I	CD error signal from loader
112	H_D[13]	I	CD clock from loader
110	H_D[14]	I	CD left/right clock from loader
109	H_D[15]	I	CD serial data from loader
106	H_CS_0	I	DVD data start sector signal from loader
101	H_CS_1	I	DVD data error signal from loader
95	H_RDY	O	DVD data ready signal to loader
93	H_WR	I	DVD data enable signal from loader
92	H_RD	I	DVD data clock from loader

Table 25. DVD I/O Channel Interface

Pin	Signal Name	Type	Description
26, 17, 4, 12, 8, 150, 151, 152, 155, 65, 69, 73, 77, 61, 57, 50, 47, 43, 39, 34, 30	GPIO_D[20:0]	B	21 General purpose I/O's
98, 94, 89	GPIO_H[16:14]	B	3 General purpose I/O's
149	GPIO_V10	B	General purpose I/O
199, 197, 196, 195, 194, 192	GPIO_[15:10]	B	6 General purpose I/O's
190, 188	GPIO_[8:7]	B	2 General purpose I/O's
195, 183, 181	GPIO_[4:2]	B	3 General purpose I/O's
174	GPIO_0	B	General purpose I/O

Table 26. General Purpose I/O Interface

6.12 Power and Ground

The CS98000 requires 3 different types of power supplies – PLLs, internal logic and IO pins -. The

PLLs and internal logic use 2.5 V power supply, The IO pins use 3.3 V power supply, and are 5 V input tolerant. (See [Table 27.](#))

Pin	Signal Name	Type	Description
1, 105, 158	VDD_PLL	I	2.5 V for internal PLLs
41, 66, 84, 108, 129, 141, 161, 178, 203	VDD_CORE	I	2.5 V for internal core logic
20, 38, 91, 131, 180	VDD_IO	I	3.3 V for I/O's
104, 157, 208	VSS_PLL	I	Ground for internal PLLs
36, 63, 82, 103, 126, 138, 158, 176, 200	VSS_CORE	I	Ground for internal core logic
18, 35, 58, 96, 119, 143, 182	VSS_IO	I	Ground for I/Os
