

GENERAL DESCRIPTION

EM73P361A is an advanced single chip CMOS 4-bit one-time programming (OTP) micro-controller. It contains 3K-byte OTP ROM, 52-nibble RAM, 4-bit ALU, 13-level subroutine nesting, 22-stage time base, two 12-bit timer/counters for the kernel function. EM73P361A also contains 5 interrupt sources, 1 input port, 4 bidirection I/O ports, built-in watch-dog-timer counter, tone generator and LCD driver (27x3 to 13x3).

Except low-power consumption and high speed, EM73P361A also have a sleep mode operation for power saving.

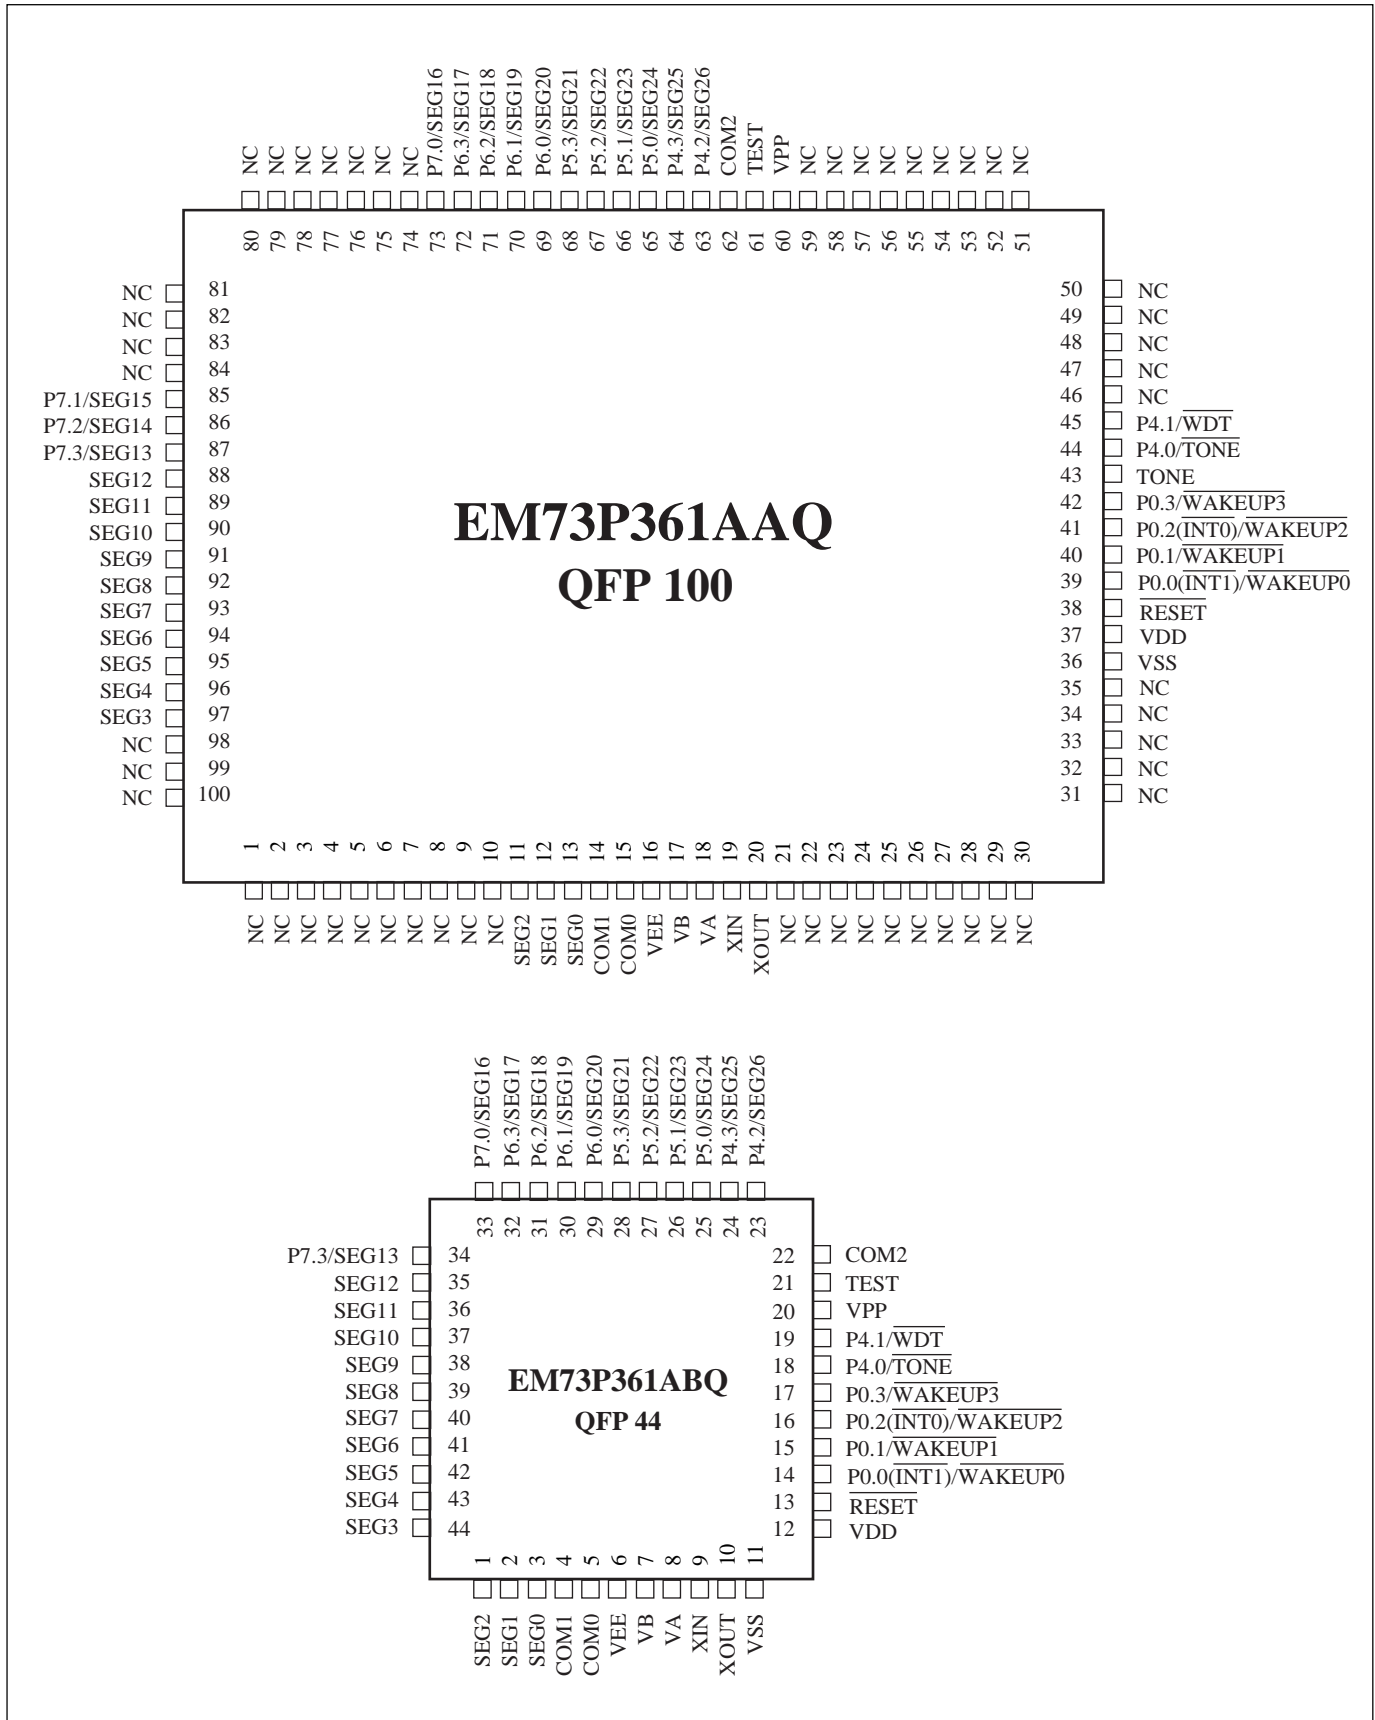

FEATURES

- Operation voltage : 2.4V to 3.6V(clock frequency : 32K Hz).
- Clock source : Single clock system for crystal, connect a external resistor or external clock source available by mask option.
- Instruction set : 109 powerful instructions.
- Instruction cycle time : 122 μ s for 32K Hz.
- OTP ROM capacity : 3072 x 8 bits.
- RAM capacity : 52 x 4 bits.
- Input port : 1 port (P0)(Pull-up and pull-down resistor with wakeup function available by mask option).
- Bidirection port : 4 ports (P4, P5, P6, P7) are available by mask option. (each I/O pin is push-pull and open-drain available by mask option) P4.0 is high current pin (P4.0 and TONE available by mask option). P4.2~P4.3, P5, P6 and P7 are shared with SEG26-SEG13 by mask option.
- 12-bit timer/counter : Two 12-bit timer/counters are programmable for timer mode.
- Low voltage reset (LVR) : Reset at 2.2V, and reset release at 2.4V.
- Tone generator : There is a built-in tone generator.
- Built-in time base counter : 22 stages.
- Subroutine nesting : Up to 13 levels.
- Interrupt : External 2 External interrupt (INT0, INT1).
Internal 2 Timer overflow interrupts.
1 Time base interrupt.
- LCD driver : 27 X 3 to 13 X 3 dots available by mask option. Capacitor divider and resistor divider are available by mask option. 1/3, 1/2 and static three kinds of duty (1/2 bias) selectable. The programming method of LCD driver is I/O mapping.
- Built-in watch-dog-timer : The WDT is enabled or disabled by mask option.
- Power saving function : Sleep mode and Hold mode.
- Package type : EM73P361AH Chip form 47 pins.
EM73P361AAQ QFP 100 pins.
EM73P361ABQ QFP 44 pins.

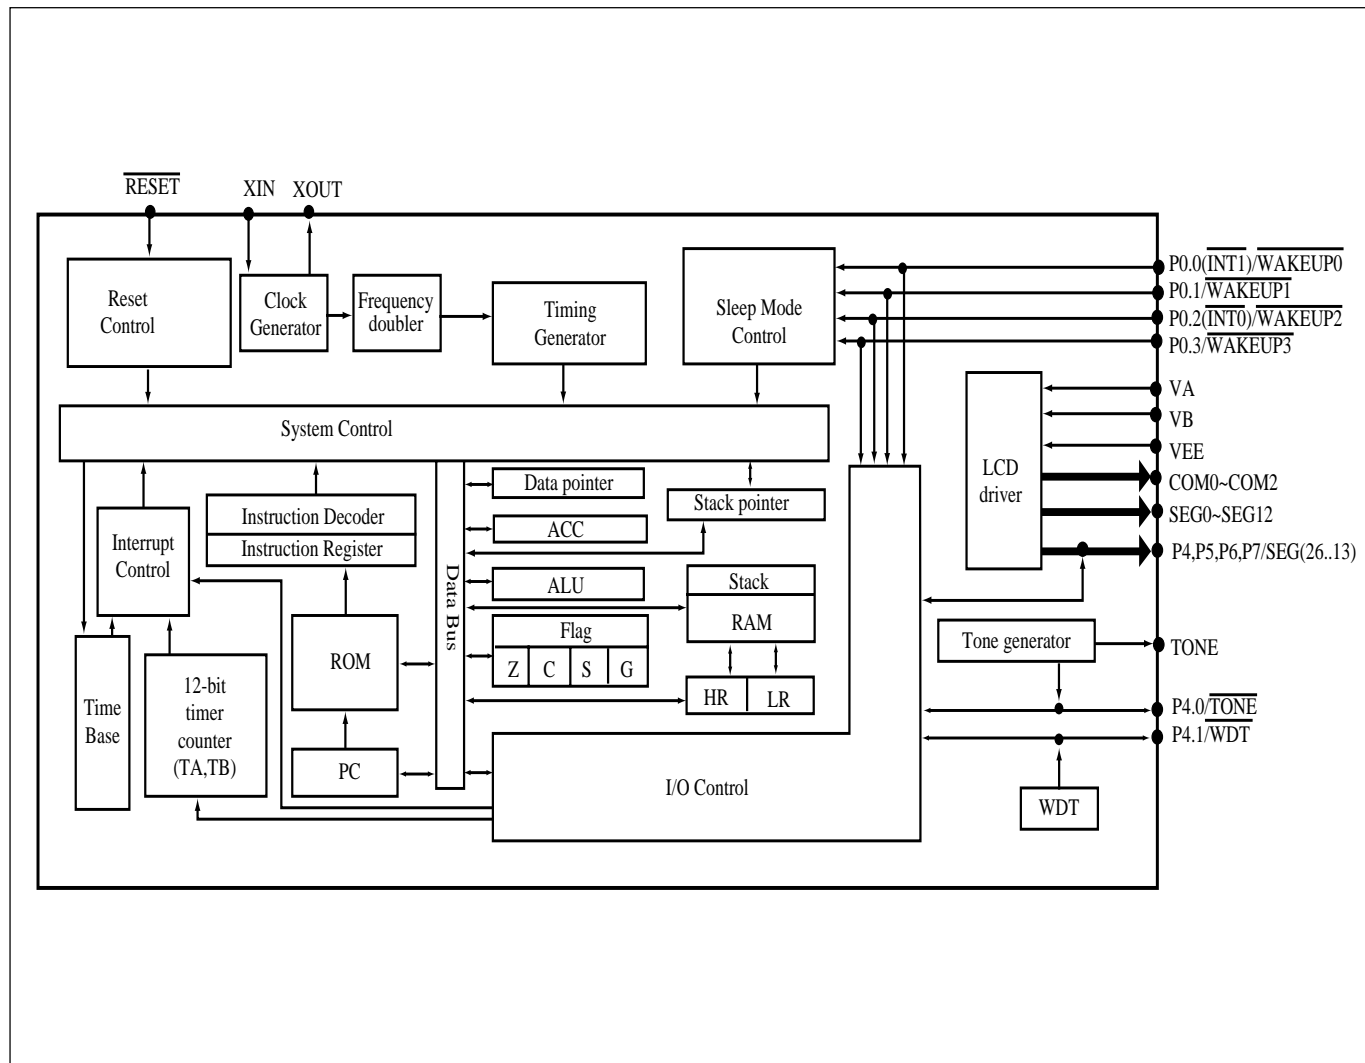

APPLICATIONS

EM73P361A is suitable for application in family appliance, consumer products, hand held games and the toy controller.

PIN CONFIGURATIONS

FUNCTION BLOCK DIAGRAM

PIN DESCRIPTIONS

Symbol	Pin-type	Function
V_{DD}		Power supply (+) In programming OTP mode: Power supply (+)
VSS		Power supply (-) In programming OTP mode: Power supply (-)
RESET	RESET-A	System reset input signal, low active Internal pull-up In programming OTP mode: Reset input pin, low active
XIN	OSC-A/OSC-F	Crystal/external resistor or external clock source connecting pin
XOUT	OSC-A/OSC-F	Crystal/external resistor connecting pin
P0.0($\overline{INT1}$)/WAKEUP0, P0.2($\overline{INT0}$)/WAKEUP2	INPUT-J	2-bit input port with external interrupt sources input and Sleep/Hold releasing function mask option : wakeup enable, pull-up wakeup enable, none wakeup disable, pull-up wakeup disable, none wakeup disable, pull-down In programming OTP mode: P0.0/ \overline{ACLK} : address counter clock for programming OTP P0.2/ \overline{OE} : data output enable for programming OTP
P0.1/WAKEUP1, P0.3/WAKEUP3	INPUT-H	2-bit input port with Sleep/Hold releasing function mask option : wakeup enable, pull-up wakeup enable, none wakeup disable, pull-up wakeup disable, pull-down wakeup disable, none In programming OTP mode: P0.1/ \overline{PGM} : program data to OTP for programming OTP P0.3/ \overline{DCLK} : data in/out clock signal for programming OTP
P4.0/ \overline{TONE}	I/O-O	1-bit bidirection I/O pin or inverse tone generator output mask option : \overline{TONE} enable, push-pull, high current PMOS \overline{TONE} disable, open-drain \overline{TONE} disable, push-pull, high current PMOS \overline{TONE} disable, push-pull, low current PMOS In programming OTP mode: P4.0/ \overline{DIN} : data input for programming OTP

Symbol	Pin-type	Function
P4.1/WDT	I/O-D	1-bit bidirection I/O pin with watch-dog-timer output mask option : open-drain push-pull In programming OTP mode: P4.1/DOUT: data output for programming OTP
P4(2..3)/SEG(26..25) P5(0..3)/SEG(24..21) P6(0..3)/SEG(20..17) P7(0..3)/SEG(16..13)	I/O-P	4-bit bidirection I/O ports are shared with LCD segment pins mask option : segment enable, open-drain segment disable, push-pull segment disable, open-drain
TONE		Built-in tone generator output
VA, VB, VEE		Connect the capacitors for LCD bias voltage
COM0~COM2		LCD common output pins
SEG0~SEG12		LCD segment output pins
TEST		Internal pull down
VPP		Connect to VDD In programming OTP mode: High voltage power source for programming OTP

FUNCTION DESCRIPTIONS

PROGRAM ROM (3K X 8 bits)

3 K x 8 bits program ROM contains user's program and some fixed data .

The basic structure of program ROM can be divided into 4 parts.

1. Address 000h: Reset start address.
2. Address 002h - 00Ch: 4 kinds of interrupt service routine entry addresses .
3. Address 00Eh-086h : SCALL subroutine entry address, only available at 00Eh,016h,01Eh,026h, 02Eh, 036h, 03Eh, 046h, 04Eh, 056h, 05Eh, 066h, 06Eh, 076h ,07Eh, 086h .
4. Address 000h - 7FFh : LCALL subroutine entry address
5. Address 000h - BFFh : Except used as above function, the other region can be used as user's program region.

address 3072 x 8 bits

000h	Reset start address
002h	INT0 ; External interrupt service routine entry address
004h	
006h	TRGA; Timer/counter A interrupt service routine entry address
008h	TRGB; Timer/counter B interrupt service routine entry address
00Ah	TBI; Time base interrupt service routine entry address
00Ch	INT1; External interrupt service routine entry address
00Eh	
086h	- - - SCALL, subroutine call entry address
⋮	
BFFh	

User's program and fixed data are stored in the program ROM. User's program is according the PC value to send next executed instruction code. Fixed data can be read out by table-look-up instruction. Table-look-up instruction is depended on the Data Pointer (DP) to indicate to ROM address, then to get the ROM code data.

LDAX $Acc \leftarrow ROM[DP]_L$
LDAXI $Acc \leftarrow ROM[DP]_H, DP+1$

DP is a 12-bit data register which can store the program ROM address to be the pointer for the ROM code data. First, user load ROM address into DP by instruction "STADPL, STADPM, STADPH", then user can get the lower nibble of ROM code data by instruction "LDAX" and higher nibble by instruction "LDAXI".

PROGRAM EXAMPLE: Read out the ROM code of address 777h by table-look-up instruction.

```
LDIA #07h;
STADPL   ; [DP]L ← 07h
STADPM   ; [DP]M ← 07h
STADPH   ; [DP]H ← 07h, Load DP=777h
:
LDL #00h;
LDH #03h;
LDAX     ; ACC ← 6h
STAMI    ; RAM[30] ← 6h
LDAXI    ; ACC ← 5h
STAM     ; RAM[31] ← 5h
;
ORG 777h
DATA 56h;
:
```

DATA RAM (52-nibble)

There is total 52 - nibble data RAM from address 00 to 33h
Data RAM includes 3 parts: zero page region, stacks and data area.

ZERO- PAGE:

From 00h to 0Fh is the location of zero-page. It is used as the pointer in zero -page addressing mode for the instruction of "STD #k,y; ADD #k,y; CLR y,b; CMP k,y".

PROGRAM EXAMPLE: To wirte immediate data "07h" to address "03h" of RAM and to clear bit 2 of RAM.

```
STD #07h, 03h ; RAM[03] ← 07h
CLR 0Eh,2 ; RAM[0Eh]2 ← 0
```

STACK:

There are 13 - level (maximum) stack for user using for subroutine (including interrupt and CALL). User can assign any level be the starting stack by giving the level number to stack pointer (SP).

When user using any instruction of CALL or subroutine, before entry the subroutine, the previous PC address will be saved into stack until return from those subroutines, the PC value will be restored by the data saved in stack.

DATA AREA:

Except the special area used by user, the whole RAM can be used as data area for storing and loading general data.

ADDRESSING MODE

(1) Indirect addressing mode:

Indirect addressing mode indicates the RAM address by specified HL register.

For example: LDAM ; $Acc \leftarrow RAM[HL]$
STAM ; $RAM[HL] \leftarrow Acc$

(2) Direct addressing mode:

Direct addressing mode indicates the RAM address by immediate data.

For example: LDA x ; $Acc \leftarrow RAM[x]$
STA x ; $RAM[x] \leftarrow Acc$

(3) Zero-page addressing mode

For zero-page region, user can using direct addressing to write or do any arithmetic, comparsion or bit manipulated operation directly.

For example: STD #k,y ; $RAM[y] \leftarrow \#k$
ADD #k,y ; $RAM[y] \leftarrow RAM[y] + \#k$

PROGRAM COUNTER (3K ROM)

Program counter (PC) is composed by a 12-bit counter, which indicates the next executed address for the instruction of program ROM.

For a 3K - byte size ROM, PC can indicate address form 000h - BFFh, for BRANCH and CALL instrcutions, PC is changed by instruction indicating.

(1) Branch instruction:

SBR a

Object code: 00aa aaaa

Condition: $SF=1$; $PC \leftarrow PC_{11-6,a}$ (branch condition satisfied)

PC

Hold original PC value+1	a	a	a	a	a	a
--------------------------	---	---	---	---	---	---

$SF=0$; $PC \leftarrow PC + 1$ (branch condition not satisfied)

PC

Original PC value + 1

LBR a

Object code: 1100 aaaa aaaa aaaa

Condition: $SF=1$; $PC \leftarrow a$ (branch condition satisfied)

PC

a	a	a	a	a	a	a	a	a	a	a	a
---	---	---	---	---	---	---	---	---	---	---	---

PC	Original PC value + 2
----	-----------------------

PC	0	0	0	0	a	a	a	a	a	a	a
----	---	---	---	---	---	---	---	---	---	---	---

[illegible]

PC	The return address stored in stack
----	------------------------------------

PC	The return address stored in stack
----	------------------------------------

PC 0 0 0 0 0 0 0 0 0 0 1 0

[illegible]

PC	0	0	0	0	0	0	0	0	1	0	0	0
----	---	---	---	---	---	---	---	---	---	---	---	---

PC	0	0	0	0	0	0	0	0	1	0	1	0
----	---	---	---	---	---	---	---	---	---	---	---	---

$\overline{\text{INT1}}$ (External interrupt from P0.0)

PC

0	0	0	0	0	0	0	0	0	1	1	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

(4) Reset operation:

PC

0	0	0	0	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

(5) Other operations:

For 1-byte instruction execution: PC + 1

For 2-byte instruction execution: PC + 2

ACCUMULATOR

Accumulator is a 4-bit data register for temporary data . For the arithmetic, logic and comparative operation ..., ACC plays a role which holds the source data and result .

FLAGS

There are four kinds of flag, CF (Carry flag), ZF (Zero flag), SF (Status flag) and GF (General flag), these 4 1-bit flags are affected by the arithmetic, logic and comparative operation .

All flags will be put into stack when an interrupt subroutine is served, and the flags will be restored after RTI instruction executed .

(1) Carry Flag (CF)

The carry flag is affected by following operation:

- a. Addition : CF as a carry out indicator, when the addition operation has a carry-out, CF will be "1", in another word, if the operation has no carry-out, CF will be "0".
- b. Subtraction : CF as a borrow-in indicator, when the subtraction operation must has a borrow, in the CF will be "0", in another word, if no borrow-in, CF will be "1".
- c. Comparision: CF is as a borrow-in indicator for Comparision operation as the same as subtraction operation.
- d. Rotation: CF shifts into the empty bit of accumulator for the rotation and holds the shift out data after rotation.
- e. CF test instruction : For TFCFC instruction, the content of CF sends into SF then clear itself "0".
For TTSTFC instruction, the content of CF sends into SF then set itself "1".

(2) Zero Flag (ZF)

ZF is affected by the result of ALU, if the ALU operation generate a "0" result, the ZF will be "1", otherwise, the ZF will be "0".

(3) Status Flag (SF)

The SF is affected by instruction operation and system status .

- a. SF is initiated to "1" for reset condition .
- b. Branch instruction is decided by SF, when SF=1, branch condition will be satisfied, otherwise, branch condition will not be satisfied by SF = 0 .

(4) General Flag (GF)

GF is a one bit general purpose register which can be set, clear, test by instruction SGF, CGF and TGS.
PROGRAM EXAMPLE:

Check following arithmetic operation for CF, ZF, SF

	CF	ZF	SF
LDIA #00h;	-	1	1
LDIA #03h;	-	0	1
ADDA #05h;	-	0	1
ADDA #0Dh;	-	0	0
ADDA #0Eh;	-	0	0

ALU

The arithmetic operation of 4 - bit data is performed in ALU unit . There are 2 flags can be affected by the result of ALU operation, ZF and SF . The operation of ALU can be affected by CF only .

ALU STRUCTURE

ALU supported user arithmetic operation function, including : addition, subtraction and rotaion.

ALU FUNCTION

(1) Addition:

For instruction ADDAM, ADCAM, ADDM #k, ADD #k,y ALU supports addition function. The addition operation can affect CF and ZF. For addition operation, if the result is "0", ZF will be "1", otherwise, not equal "0", ZF will be "0", When the addition operation has a carry-out. CF will be "1", otherwise, CF will be "0".

EXAMPLE:

Operation	Carry	Zero
3+4=7	0	0
7+F=6	1	0
0+0=0	0	1
8+8=0	1	1

(2) Subtraction:

For instruction SUBM #k, SUBA #k, SBCAM, DECM... ALU supports user subtraction function . The subtraction operation can affect CF and ZF, For subtraction operation, if the result is negative, CF will

be "0", it means a borrow out, otherwise, if the result is positive, CF will be "1". For ZF, if the result of subtraction operation is "0", the ZF will be "1", otherwise, ZF will be "0".

EXAMPLE:

Operation	Carry	Zero
8-4=4	1	0
7-F= -8(1000)	0	0
9-9=0	1	1

(3) Rotation:

There are two kinds of rotation operation, one is rotation left, the other is rotation right.

RLCA instruction rotates Acc value to left, shift the CF value into the LSB bit of Acc and the shift out data will be hold in CF.

RRCA instruction operation rotates Acc value to right, shift the CF value into the MSB bit of Acc and the shift out data will be hold in CF.

PROGRAM EXAMPLE: To rotate Acc right and shift a "1" into the MSB bit of Acc .

TTCFS; CF ← 1

RRCA; rotate Acc right and shift CF=1 into MSB.

HL REGISTER

HL register are two 4-bit registers, they are used as a pair of pointer for the address of RAM memory and also 2 independent temporary 4-bit data registers. For some instruction, L register can be a pointer to indicate the pin number (Port4, Port6, Port7) .

HL REGISTER STRUCTURE

HL REGISTER FUNCTION

- (1) For instruction : LDL #k, LDH #k, THA, THL, INCL, DECL, EXAL, EXAH, HL register used as a temporary register .

PROGRAM EXAMPLE: Load immediate data "5h" into L register, "Dh" into H register.

LDL #05h;

LDH #0Dh;

- (2) For instruction LDAM, STAM, STAMI .., HL register used as a pointer for the address of RAM memory.

PROGRAM EXAMPLE: Store immediate data #Ah into RAM of address 35h.

```
LDL #5h;
LDH #3h;
STDMI #0Ah; RAM[35] ← Ah
```

(3) For instruction : SELP, CLPL, TFPL, L register be a pointer to indicate the bit of I/O port.

When LR = 0 - 1, indicate P4.0 - P4.1.

PROGRAM EXAMPLE: To set bit 1 of Port4 to "1"

```
LDL #01h;
SEPL ; P4.1 ← 1
```

STACK POINTER (SP)

Stack pointer is a 4-bit register which stores the present stack level number.

Before using stack, user must set the SP value first, CPU will not initiate the SP value after reset condition . When a new subroutine is accepted, the SP will be decreased one automatically, in another word, if returning from a subroutine, the SP will be increased one .

The data transfer between ACC and SP is by instruction of "LDASP" and "STASP".

DATA POINTER (DP)

Data pointer is a 12-bit register which stores the address of ROM can indicate the ROM code data specified by user (refer to data ROM).

CLOCK AND TIMING GENERATOR

The clock generator is supported by a single clock system, the clock source comes from crystal (resonator) or RC oscillation, the working frequency range is 32 KHz to 100 KHz depending on the working voltage.

CLOCK AND TIMING GENERATOR STRUCTURE

The clock generator connects outside components (crystal or resonator by XIN and XOUT pin for crystal osc type, capacitor for RC osc type, these two type is decided by mask option) the clock generator generates a basic system clock "fc".

When CPU sleeping, the clock generator will be stoped until the sleep condition released. The system clock control generates 4 basic phase signals (S1, S2, S3, S4) and system clock .

CLOCK AND TIMING GENERATOR FUNCTION

The frequency of f_c is the oscillation frequency for XIN, XOUT by crystal (resonator) or by RC osc.
When CPU sleeps, the XOUT pin will be in "high" state .
The instruction cycle equal 4 basic clock f_c .
1 instructure cycle = 4 / f_c

TIMING GENERATOR AND TIME BASE

The timing generator produces the system clock from basic clock pulse which can be normal mode or slow mode clock.
1 instruction cycle = 4 basic clock pulses

There are 22 stages time base .

When working in the single clock mode, the timebase clock source is come from f_c .

Time base provides basic frequency for following function:

1. TBI (time base interrupt) .
2. Timer/counter, internal clock source.
3. Warm-up time for sleep - mode releasing.

TIME BASE INTERRUPT (TBI)

The time base can be used to generate a fixed frequency interrupt . There are 8 kinds of frequencies can be selected by setting "P25"

Single clock mode

P25 3 2 1 0

--	--	--	--

 (initial value 0000)
 0 0 x x: Interrupt disable
 0 1 0 0: Interrupt frequency $XIN / 2^9$ Hz
 0 1 0 1: Interrupt frequency $XIN / 2^{10}$ Hz
 0 1 1 0: Interrupt frequency $XIN / 2^{12}$ Hz
 0 1 1 1: Interrupt frequency $XIN / 2^{13}$ Hz
 1 1 0 0: Interrupt frequency $XIN / 2^{14}$ Hz
 1 1 0 1: Interrupt frequency $XIN / 2^{15}$ Hz
 1 1 1 0: Interrupt frequency $XIN / 2^{16}$ Hz
 1 1 1 1: Interrupt frequency $XIN / 2^{17}$ Hz
 1 0 x x: Reserved

TIMER / COUNTER (TIMERA, TIMERB)

EM73P361A only can support timer function for timerA and timerB independently.

For timerA, the counter data is saved in timer register TAH, TAM, TAL, which user can set counter initial value and read the counter value by instruction "LDATAH(M,L), STATAH(M,L)" and timerB register is TBH, TBM, TBL and W/R instruction "LDATBH (M,L), STATBH (M,L)".

The basic structure of timer/counter is composed by two same structure counter, these two counters can be set initial value and send counter value to timer register, P28 and P29 are the command ports for timerA and timer B, user can choose different internal clock rate by setting these two ports. When timer/counter overflow, it will generate a TRGA(B) interrupt request to interrupt control unit.

TIMER/COUNTER CONTROL

Timer/counter command port: P28 is the command port for timer/counterA and P29 is for the timer/counterB.

Port 28	3	2	1	0
	TMSA	IPSA		
	Initial state: 0000			

Port 29	3	2	1	0
	TMSB	IPSB		
	Initial state: 0000			

TIMER/COUNTER MODE SELECTION	
TMSA (B)	Function description
0 0	Stop
0 1	Reserved
1 0	Timer mode
1 1	Reserved

INTERNAL PULSE-RATE SELECTION	
IPSA(B)	Function description
0 0	$XIN/2^5$ Hz
0 1	$XIN/2^7$ Hz
1 0	$XIN/2^{11}$ Hz
1 1	$XIN/2^{15}$ Hz

TIMER/COUNTER FUNCTION

Each timer/counter can execute the timer function independently.

TIMER MODE

For timer mode ,timer/counter increase one at any rising edge of internal pulse . User can choose 4 kinds of internal pulse rate by setting IPSB for timerB (IPSA for timerA).

When timer/counter counts overflow, TRGB (TRGA) will be generated to interrupt control unit.

PROGRAM EXAMPLE: To generate TRGA interrupt request after 60 ms with system clock XIN=32K Hz

```
LDIA    #0100B;
EXAE;   enable mask 2
EICIL 110111B; interrupt latch ← 0, enable EI
LDIA    #04H;
STATAL;
LDIA    #0CH;
STATAM;
LDIA    #0FH;
STATAH;
LDIA    #1000B;
OUTA P28; enable timerA with internal pulse rate: XIN/25 Hz
```

NOTE: The preset value of timer/counter register is calculated as following procedure.

Internal pulse rate: $XIN/2^5$; $XIN = 32KHz$

The time of timer counter count one = $2^5 / XIN = 32/32K = 1ms$

The number of internal pulse to get timer overflow = $60 ms / 1ms = 60 = 03CH$

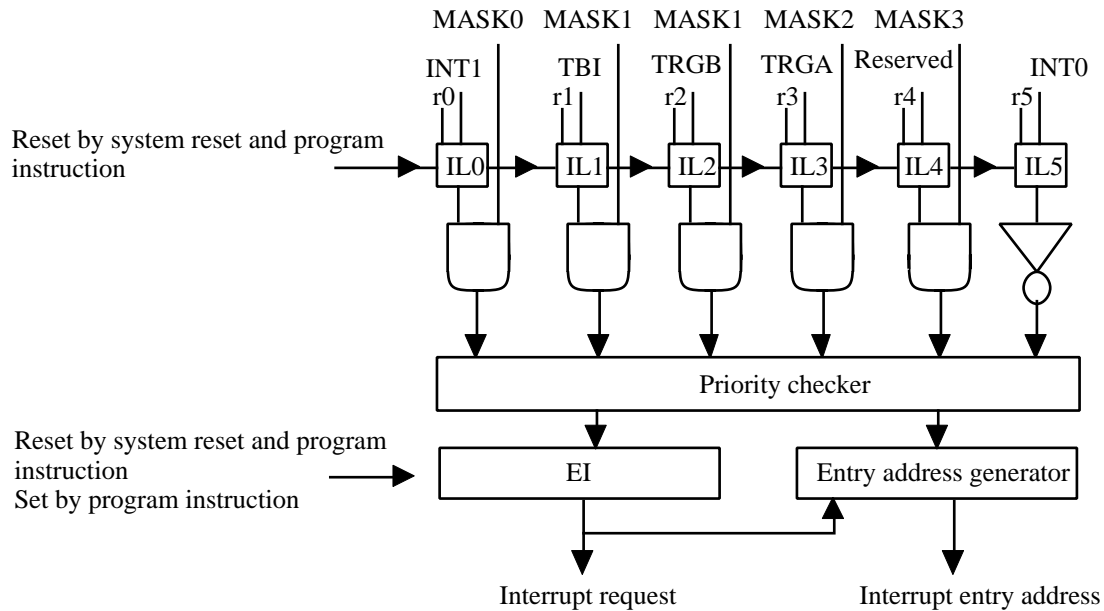

The preset value of timer/counter register = $1000H - 03CH = 0FC4H$

INTERRUPT FUNCTION

There are 3 internal interrupt sources and 2 external interrupt sources. Multiple interrupts are admitted according the priority .

Type	Interrupt source	Priority	Interrupt Latch	Interrupt Enable condition	Program ROM entry address
External	External interrupt ($\overline{INT0}$)	1	IL5	EI=1	002H
Internal	Reserved	2	IL4	EI=1, MASK3=1	004H
Internal	TimerA overflow interrupt (TRGA)	3	IL3	EI=1, MASK2=1	006H
Internal	TimerB overflow interrupt (TRGB)	4	IL2	EI=1, MASK1=1	008H
Internal	Time base interrupt(TBI)	5	IL1		00AH
External	External interrupt (INT1)	6	IL0	EI=1,MASK0=1	00CH

INTERRUPT STRUCTURE

Interrupt controller:

IL0-IL5 : Interrupt latch . Hold all interrupt requests from all interrupt sources. ILr can not be set by program, but can be reset by program or system reset, so IL only can decide which interrupt source can be accepted.

MASK0-MASK3 : MASK register can permit or inhibit all interrupt sources.

EI : Enable interrupt Flip-Flop can permit or inhibit all interrupt sources, when interrupt happened, EI is cleared to "0" automatically, after RTI instruction happened, EI will be set to "1" again .

Priority checker: Check interrupt priority when multiple interrupts happened.

INTERRUPT FUNCTION

The procedure of interrupt operation:

1. Push PC and all flags to stack.
2. Set interrupt entry address into PC.
3. Set SF= 1.
4. Clear EI to inhibit other interrupts happened.
5. Clear the IL for which interrupt source has already be accepted.
6. To excute interrupt subroutine from the interrupt entry address.
7. CPU accept RTI, restore PC and flags from stack . Set EI to accept other interrupt requests.

PROGRAM EXAMPLE: To enable interrupt of "TRGA"

```
LDIA #1100B;
EXAE; set mask register "1100B"
EICIL 111111B ; enable interrupt F.F.
```

POWER SAVING FUNCTION (Sleep / Hold function)

During sleep and hold condition, CPU holds the system's internal status with a low power consumption, for the sleep mode, the system clock will be stoped in the sleep condition and system need a warm up time for the stability of system clock running after wakeup . In the other way, for the hold mode, the system clock does not stop at all and it does not need a warm-up time any way.

The sleep and hold mode is controlled by Port 16 and released by P0(0..3)/WAKEUP0..3.

P16 3 2 1 0

WM	SE	SWWT
----	----	------

initial value :0000

SWWT	Set wake-up warm-up time
0 0	2^{17} /XIN
0 1	2^{13} /XIN
1 0	2^{15} /XIN
1 1	Hold mode

WM	Set wake-up release mode
0	Wake-up in edge release mode
1	Reserved

SE	Enable sleep/hold
0	Reserved
1	Enable sleep / hold rnode

Sleep and hold condition:

1. Osc stop (sleep only) and CPU internal status held .
2. Internal time base clear to "0".
3. CPU internal memory ,flags, register, I/O held original states.
4. Program counter hold the executed address after sleep release.

Release condition:

1. Osc start to oscillating.(sleep only).
2. Warm-up time passing (sleep only).
3. According PC to execute the following program.

There is one kind of sleep/hold release mode .

1. Edge release mode:

Release sleep/hold condition by the falling edge of any one of P0(0..3)/WAKEUP0..3.

Note : There are 4 independent mask options for wakeup function in EM73360. So, the wakeup function of P0(0..3)/WAKEUP0..3 are enabled or disabled inpendently.

LCD DRIVER

EM73P361A can directly drive the liquid crystal display (LCD) and has 27 segment, 3 common output pins. There are total 27 x 3 dots can be display. The VDD, VEE and VSS pins are the bias voltage inputs of the LCD driver. The VA and VB are used to the voltage double for 3V system. The method of LCD programming is I/O mapping.

CONTROL OF LCD DRIVER

The LCD driver control command register is P27. When LDC is 00, the LCD is disabled. When LDC is 01, the LCD is blanking,

the COM pins are inactive and the SEG pins continuously output the display data. When LDC is 11, the LCD driver enables, the power switch is turned on and it cannot be turned off forever except the CPU is reseted or sleeping. Users must enable the LCD driver by self when the CPU is waked up.

Port27 3 2 1 0 Initial value : 0000

LDC	DUTY
-----	------

LDC	LCD display control
0 0	LCD display disable & change duty
0 1	Blanking
1 0	Reserved
1 1	LCD display enable

DUTY	Driving method select
0 0	Reserved
0 1	1/3 duty (1/2 bias)
1 0	1/2 duty (1/2 bias)
1 1	Static

LCD driving methods

There are four kinds of driving methods can be selected by DUTY (P27.0~P27.1). The driving waveforms of LCD driver are as below :

LCD Frame frequency : According to the drive method to set the frame frequency.

Driving method	Frame frequency (Hz)
1/3 duty	$43 \times (3/3) = 43$
1/2 duty	$43 \times (3/2) = 64$
Static	43

The relation between LCD display data and driving method

Driving method	bit3	bit2	bit1	bit0
1/3 duty	-	COM2	COM1	COM0
1/2 duty	-	-	COM1	COM0
Static	-	-	-	COM0

LCD drive voltage

EM73P361A provides 2 kinds of LCD bias methods, capacitor divider and resistor divider, when the LCD bias method is capacitor divider, the VA is connected a capacitor to VB and the VEE is connected a capacitor to VSS. The output of VEE is 1.5V for LCD bias voltage. When the LCD bias method is resistor divider, the VEE is floating.

LCD DISPLAY OPERATION

The LCD programming method is I/O mapping and P10~P12 are must be used.

Address register of LCD display buffer

It is a 5-bit register to specify address for LCD display buffer.

Data register of LCD display buffer

P12 is a 3-bit data register to read or write LCD display buffer.

TONE GENERATOR

EM73P361A has a built-in tone generator. It is a binary down counter. When the CPU is reseted or sleeping, the tone generator is disabled and the output (P4.0/TONE) is high.

Tone generator command register

SM	Sound generator mode
0	Tone generator disable
1	Tone generator enable

Tone frequency register

The 8-bit tone frequency register is P24 and P23. The tone frequency will be changed when user output the different data to P23. Thus, the data must be output to P24 before P23 when user want to change the 8-bit tone frequency (TF).

** $f_1 = XIN / (TF + 1)$, $TF = 1 \sim 255$, $TF \neq 0$

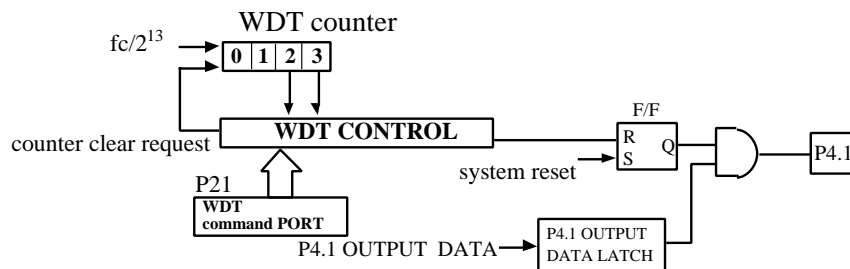

** Example : $XIN = 32K \text{ Hz}$, $TF = 00110001B$.

$\Rightarrow f_0 = 32K \text{ Hz} / 50 = 655.36 \text{ Hz}$

WATCH-DOG-TIMER (MASK OPTION)

Watch-dog-timer can help user to detect the malfunction (runaway) of CPU and give system a time up signal every certain time . User can use the time up signal to give system a reset signal when system is fail. When CPU is reseted or sleeping, the watch-dog-timer is disabled. Users must enable the watch-dog-timer by self when CPU is waked up.

The basic structure of watch-dog-timer control is composed by a 4-stage binary counter and a control unit . the WDT counter counts for a certain time to check the CPU status, if there is no malfunction happened, the counter will be cleared and counting . Otherwise, if there is a malfunction happened, the WDT control will send a WDT signal (low active) to outside, user can use this signal to reset CPU . The WDT checking period is assign by P21 (WDT command port)

P21 is the control port of watchdog timer, and the watchdog timer timeup signal is output by $P4.1/\overline{WDT}$, user can use this timeup signal (active low) to reset CPU and initialize system.

Port 21 Initial value : 0000

3	2	1	0
CWC	*	*	WDT

CWC	Clear watchdog timer counter
0	Clear counter then return to 1
1	Nothing

WDT	Set watchdog timer detect time
0	$3 \times 2^{13} / f_c = 3 \times 2^{13} / 32 \text{ KHz} = 0.75 \text{ sec}$
1	$7 \times 2^{13} / f_c = 7 \times 2^{13} / 32 \text{ KHz} = 1.75 \text{ sec}$

PROGRAM EXAMPLE

To enable WDT with $3 \times 2^{13}/f_c$ detection ftime.

```
LDIA #0000B
```

```
OUTA P21; set WDT detection time and clear WDT counter
```

RESETTING FUNCTION

When CPU in normal working condition and $\overline{\text{RESET}}$ pin holds in low level for three instruction cycles at least, then CPU begins to initialize the whole internal states, and when RESET pin changes to high level, CPU begins to work in normal condition.

The CPU internal state during reset condition is as following table :

Hardware condition in RESET state	Initial value
Program counter	000h
Status flag	01h
Interrupt enable flip-flop (EI)	00h
MASK0 ,1, 2, 3	00h
Interrupt latch (IL)	00h
P10, 11, 12, 16, 21, 25, 27, 28, 29, 30	00h
P4, 5, 6, 7, 23, 24	0Fh
XIN	Start oscillation

The $\overline{\text{RESET}}$ pin is a hysteresis input pin and it has a internal pull-up resistor.

The simplest RESET circuit is connect $\overline{\text{RESET}}$ pin with a capacitor to V_{SS} and a diode to V_{DD} .

EM73P361A I/O PORT DESCRIPTION :

Port	Input function		Output function		Note

****** SYMBOL DESCRIPTION**

Symbol	Description	Symbol	Description
HR	H register	LR	L register
PC	Program counter	DP	Data pointer
SP	Stack pointer	STACK[SP]	Stack specified by SP
A _{cc}	Accumulator	FLAG	All flags
CF	Carry flag	ZF	Zero flag
SF	Status flag	GF	General flag
EI	Enable interrupt register	IL	Interrupt latch
MASK	Interrupt mask	PORT[p]	Port (address : p)
TA	Timer/counter A	TB	Timer/counter B
RAM[HL]	Data memory (address : HL)	RAM[x]	Data memory (address : x)
ROM[DP] _L	Low 4-bit of program memory	ROM[DP] _H	High 4-bit of program memory
[DP] _L	Low 4-bit of data pointer register	[DP] _M	Middle 4-bit of data pointer register
[DP] _H	High 4-bit of data pointer register	[TA] _L ([TB] _L)	Low 4-bit of timer/counter A (timer/counter B) register
[TA] _M ([TB] _M)	Middle 4-bit of timer/counter A (timer/counter B) register	[TA] _H ([TB] _H)	High 4-bit of timer/counter A (timer/counter B) register
←	Transfer	↔	Exchange
+	Addition	-	Substraction
&	Logic AND	∨	Logic OR
^	Logic XOR	'	Inverse operation
.	Concatenation	#k	4-bit immediate data
x	8-bit RAM address	y	4-bit zero-page address
p	4-bit or 5-bit port address	b	Bit address
r	6-bit interrupt latch	PC ₁₁₋₆	Bit 11 to 6 of program counter
LR ₁₋₀	Contents of bit assigned by bit 1 to 0 of LR	a ₅₋₀	Bit 5 to 0 of destination address for branch instruction
LR ₃₋₂	Bit 3 to 2 of LR
