Operation voltage	2.2 ~ 3.6V	2.5V ~ 5.5V

I. General Description

The EM78805A is an 8-bit CID (Call Identification) RISC type microprocessor with low power , high speed CMOS technology . Integrated onto a single chip are on_chip watchdog (WDT) , RAM , ROM , programmable real time clock /counter , internal interrupt , power down mode , LCD driver , Tone generator and tri-state I/O . The EM78805A/B provides a single chip solution to design a CID of calling message display .

II. Feature

CPU

- **Operating voltage range : 2.2V~3.6V**
- 8Kx 13 on chip ROM
- **1.1Kx 8 on chip RAM**
- **Up to 28 bi-directional tri-state I/O ports**
- 8 level stack for subroutine nesting
- 8-bit real time clock/counter (TCC) with 8-bit prescaler
- Two sets of 8 bit counters can be interrupt sources
- Selective signal sources and overflow interrupt
- Programmable free running on chip watchdog timer
- 99.9% single instruction cycle commands
- four modes (Main clock 3.579 , 1.79, 0.895 or 0.447MHz generated by internal PLL)
 1. Sleep mode : CPU and Main clock turn off, 32.768KHz clock turn off
 2. Idle mode : CPU and Main clock turn off, 32.768KHz clock turn on
 3. Green mode : Main clock turn off, CPU and 32.768KHz clock turn on
 4. Normal mode : Main clock turn on , CPU and 32.768KHz clock turn on
- Input port wake up function
- **7 interrupt source , 4 external , 3 internal**
- IO Port key scan function
- IO Port interrupt , pull high ,wake-up and open drain functions
- External Sub-Clock frequency is 32.768KHz
- Dual TONE Generators

LCD

- LCD operation voltage chosen by software
- Common driver pins : 16 (8 of 16 Common shared by I/O)
- Segment driver pins : 32 (12 of 32 Segment shared by I/O)
- 1/4 bias
- 1/8,1/16 duty

PACKAGE

- **64 pin QFP (EM78805AAQ, POVD disable) (EM78805ABQ, POVD enable) or 64 pin Chip (EM78805AH)**

III. Application

1. adjunct units
2. answering machines
3. feature phones

P5.4 ~P.57	PORT5	PORT5 can be INPUT or OUTPUT port each bit. And shared with Segment signal.
P7.0 ~P7.7	PORT7	PORT7 can be INPUT or OUTPUT port each bit. Internal Pull high function. Key scan function. Bit6,7 open drain function
P6.0 ~P6.7	PORT6	PORT6 can be INPUT or OUTPUT port each bit. And shared with Common signal.
P9.0 ~P9.7	PORT9	PORT 9 can be INPUT or OUTPUT port each bit. And shared with Segment signal. Bit6,7 has wake-up function.
TEST	I	Test pin into test mode , normal low
TONE	O	Tone generator's output
RESET	I	

VII.Functional Descriptions

VII.1 Operational Registers

1. R0 (Indirect Addressing Register)

* R0 is not a physically implemented register. It is useful as indirect addressing pointer. Any instruction using R0 as register actually accesses data pointed by the RAM Select Register (R4).

2. R1 (TCC)

* Increased by an external signal edge applied to TCC , or by the instruction cycle clock.

Written and read by the program as any other register.

3. R2 (Program Counter)

* The structure is depicted in Fig.3

* Generates $8K \times 13$ on-chip ROM addresses to the relative programming instruction codes.

* "JMP" instruction allows the direct loading of the low 10 program counter bits.

* "CALL" instruction loads the low 10 bits of the PC, PC+1, and then push into the stack.

* "RET" ("RETL k", "RETI") instruction loads the program counter with the contents at the top of stack.

* "MOV R2,A" allows the loading of an address from the A register to the PC, and the ninth and tenth bits are cleared to "0".

- * "ADD R2,A" allows a relative address be added to the current PC, and contents of the ninth and tenth bits are cleared to "0".
- * "TBL" allows a relative address be added to the current PC, and contents of the ninth and tenth bits don't change. The most significant bit (A10~A12) will be loaded with the content of bit PS0~PS2 in the status register (R5) upon the execution of a "JMP", "CALL", "ADD R2,A", or "MOV R2,A" instruction.

4. R3 (Status Register)

7	6	5	4	3	2	1	0
PAGE	P_TONE2	P_TONE1	T	P	Z	DC	C

- * Bit 0 (C) Carry flag
- * Bit 1 (DC) Auxiliary carry flag
- * Bit 2 (Z) Zero flag
- * Bit 3 (P) Power down bit. Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.
- * Bit 4 (T) Time-out bit. Set to 1 by the "SLEP" and "WDTC" command, or during power up and reset to 0 by WDT timeout.

EVENT	T	P	REMARK
WDT wake up from sleep mode	0	0	
WDT time out (not sleep mode)	0	1

01	Power off	Power on
10	Power on	Power off
11	Power on	Power on

* Bit 7 PAGE : change IOCB ~ IOCE to another page , 0/1 => page0 / page1

5. R4 (RAM Select Register)

- * Bits 0 ~ 5 are used to select up to 64 registers in the indirect addressing mode.
- * Bits 6 ~ 7 determine which bank is activated among the 4 banks.
- * See the configuration of the data memory in Fig. 5.

6. R5 (Program Page Select Register)

7	6	5	4	3	2	1	0
R57	R56	R55	R54	x	PS2	PS1	PS0

* Bit 0 (PS0) ~ Bit2 (PS2) Page select bits should be set before JMP or CALL instruction.

Page select bits

PS2	PS1	PS0	Program memory page (Address)
0	0	0	Page 0
0	0	1	Page 1
0	1	0	Page 2
0	1	1	Page 3
1	0	0	Page 4
1	0	1	Page 5
1	1	0	Page 6
1	1	1	Page 7

User can use PAGE instruction to change page. To maintain program page by user. Otherwise, user can use far jump (FJMP) or far call (FCALL) instructions to program user's code. And the program page is maintained by EMC's compiler. It will change user's program by inserting instructions within program.

***Bit3 : unused**

*Bit4 ~7: 4-bit I/O registers.

6. R6 ~ R9 (Port 6 ~ Port 9)

* R6, R7 and R9 are three 8-bit I/O registers for Port6, Port7 and Port9. **R8 is unaccess.**

7. RA

IDLE	/358E	CLK2	CLK1	x	x	x	x

* **Bit0~Bit3 : unused**

* Bit4~ Bit5: MAIN clock selection bits.

User can choose the main clock by CLK1 and CLK2. All the clock is list below.

CLK2, CLK1	MAIN clock	/358E	CPU's clock
0,0	0.447MHz	1	0.447MHz
0,1	0.895MHz	1	0.895MHz

1,0	1.79MHz	1	1.79MHz
1,1	3.579MHz	1	3.579MHz
0,0	X	0	32768HZ
0,1	X	0	32768HZ
1,0	X	0	32768HZ
1,1	X	0	32768HZ

* Bit6(read/write)(PLL enable signal)

0/1=DISABLE/ENABLE

The relation between 32.768kHz and 3.579MHz can see Fig.6

Fig.6 The relation between 32.768kHz and 3.579MHz .

* Bit7 IDLE: sleep mode selection bit

0/1=sleep mode/IDLE mode. This bit will decide SLEP instruction which mode to go.

These two modes can be waken up by TCC clock or Watch Dog or PORT9 and run from "SLEP" next instruction.

Wakeup signal	SLEEP mode	IDLE mode	GREEN mode	NORMAL mode
	RA(7,6)=(0,0) + SLEP	RA(7,6)=(1,0) + SLEP	RA(7,6)=(x,0) no SLEP	RA(7,6)=(x,1) no SLEP
TCC time out	X	Wake-up + Interrupt + Next instruction	Interrupt	Interrupt
WDT time out	RESET	Wake-up + Next instruction	RESET	RESET
Port96,97	RESET	Wake-up + Next instruction	X	X
PORT70~73	RESET	Wake-up + Interrupt + Next instruction	Interrupt	Interrupt

*P70 ~ P73 's wakeup function is controlled by IOCF(1,2,3) and ENI instruction.

*P70 's wakeup signal is a rising or falling signal defined by CONT REGISTER bit7.

*Port96,Port97 ,Port71,Port72 and Port73 's wakeup signal is a falling edge signal.

VII.3 TCC/WDT Prescaler

There is an 8-bit counter available as prescaler for the TCC or WDT. The prescaler is available for the TCC only or WDT only at the same time.

- An 8 bit counter is available for TCC or WDT determined by the status of the bit 3 (PAB) of the CONT register.
- See the prescaler ratio in CONT register.
- Fig. 10 depicts the circuit diagram of TCC/WDT.
- Both TCC and prescaler will be cleared by instructions which write to TCC each time.
- The prescaler will be cleared by the WDTC and SLEP instructions, when assigned to WDT mode.
- The prescaler will not be cleared by SLEP instructions, when assigned to TCC mode.

Fig.10 Block diagram of TCC WDT

VII.4 I/O Ports

The I/O registers, Port5 ~ Port 9, are bi-directional tri-state I/O ports. Port 7 can be pulled-high internally by software control. The I/O ports can be defined as "input" or "output" pins by the I/O control registers (IOC6 ~ IOC9) under program control. The I/O registers and I/O control registers are both readable and writable. The I/O interface circuit is shown in Fig.11.

The controller can be awakened from SLEEP mode or IDLE mode (execution of "SLEP" instruction, named as SLEEP MODE or IDLE mode) by (1)TCC time out (IDLE mode only) (2) WDT time-out (if enabled) or, (3) external input at PORT9 (4)RINGTIME pin. The four cases will cause the controller wake up and run from next instruction in IDLE mode, reset in SLEEP mode. After wake-up, user should control WATCH DOG in case of reset in GREEN mode or NORMAL mode. The last three should be open RE register before into SLEEP mode or IDLE mode. The first one case will set a flag in RF bit0. And it will go to address 0x08 when TCC generate a interrupt.

VII.6 Interrupt

The CALLER ID IC has internal interrupts which are falling edge triggered, as followed : TCC timer overflow interrupt (internal), two 8-bit counters overflow interrupt.

If these interrupt sources change signal from high to low, then RF register will generate '1' flag to corresponding register if you enable IOCF register.

RF is the interrupt status register which records the interrupt request in flag bit. IOCF is the interrupt mask register. Global interrupt is enabled by ENI instruction and is disabled by DISI instruction. When one of the interrupts (when enabled) generated, will cause the next instruction to be fetched from address 008H. Once in the interrupt service routine the source of the interrupt can be determined by polling the flag bits in the RF register. The interrupt flag bit must be cleared in software before leaving the interrupt service routine and enabling interrupts to avoid recursive interrupts.

There are four external interrupt pins including INT0, INT1, INT2, INT3. And four internal counter interrupt available.

External interrupt INT0, INT1, INT2, INT3 signals are from PORT7 bit0 to bit3. If IOCF is enable then these signal will cause interrupt, or these signals will be treated as general input data.

After reset, the next instruction will be fetched from address 000H and the instruction inturrept is 001H and the hardware inturrept is 008H.

TCC will go to address 0x08 in GREEN mode or NORMAL mode after time out. And it will run next instruction from "SLEP" instruction and then go to address 0x08 in IDLE mode. These two cases will set a RF flag.

VII.7 Instruction Set

Instruction set has the following features:

- (1). Every bit of any register can be set, cleared, or tested directly.
- (2). The I/O register can be regarded as general register. That is, the same instruction can operates on I/O register.

The symbol "R" represents a register designator which specifies which one of the 64 registers (including operational registers and general purpose registers) is to be utilized by the instruction. Bits 6 and 7 in R4 determine the selected register bank. "b" represents a bit field designator which selects the number of the bit, located in the register "R", affected by the operation. "k" represents an 8 or 10-bit constant or literal value.

CODE Option Register

The IC has one CODE option register which is not part of the normal program memory. The option bits cannot be accessed during normal program execution.

7	6	5	4	3	2	1	0
-	-	-	-	-	-	/POVD	-

* Bit 0 : unused, must be "0".

* **Bit 0 : (/POVD) : Power on voltage detector.**

0: enable

1: disable

	2.0V POVD reset	1.6V power on reset	2.5V voltage detect no reset	sleep mode current
1	no	yes	no	1uA typical
0	yes	yes	yes	10uA typical

* Bits 1~7 : unused, must be "0"s.

VII.8 LCD Driver

The CALLER ID IC can drive LCD directly and has 60 segments and 16 commons that can drive 60*16 dots totally. LCD block is made up of LCD driver , display RAM, segment output pins , common output pins and LCD operating power supply pins.

Duty , bias , the number of segment , the number of common and frame frequency are determined by LCD mode register . LCD control register.

The basic structure contains a timing control which uses the basic frequency 32.768KHz to generate the proper timing for different duty and display access. RE register is a command register for LCD driver, the LCD display(disable, enable, blanking) is controlled by LCD_C and the driving duty and bias is decided by LCD_M and the display data is stored in data RAM which address and data access controlled by registers RC and RD.

* This specification are subject to be changed without notice.

7	6	5	4	3	2	1	0
-	-	-	-	-	LCD_C2	LCD_C1	LCD_M

*Bit0 (LCD_M):LCD_M decides the methods, including duty, bias, and frame frequency.

*Bit1~Bit2 (LCD_C#):LCD_C# decides the LCD display enable or blanking. change the display duty must set the LCD_C to "00".

LCD_C2,LCD_C1	LCD Display Control	LCD_M	duty	bias
0 0	change duty Disable(turn off LCD)	0 1	1/16 1/8	1/4 1/4
0 1	Blanking	:	:	:
1 1	LCD display enable	:	:	:

VII.8.2 LCD display area

The LCD display data is stored in the data RAM . The relation of data area and COM/SEG pin is as below:

COM15 ~ COM8	COM7 ~ COM0	
40H (Bit15 ~ Bit8)	00H (Bit7 ~ Bit0)	SEG0
41H	01H	SEG1
:	:	:
:	:	:
67H	27H	SEG39

7DH	3DH	empty
7EH	3EH	empty
7FH	3FH	empty

*IOCB(LCD Display RAM address)

7	6	5	4	3	2	1	0
-	LCDA6	LCDA5	LCDA4	LCDA3	LCDA2	LCDA1	LCDA0

Bit 0 ~ Bit 6 select LCD Display RAM address up to 127.

LCD RAM can be write whether in enable or disable mode and read only in disable mode.

*IOCC(LCD Display data) : Bit 0 ~ Bit 8 are LCD data.

VII.8.3 LCD COM and SEG signal

* COM signal : The number of COM pins varies according to the duty cycle used, as following: in 1/8 duty mode COM8 ~ COM15 must be open. in 1/16 duty mode COM0 ~ COM15 pins must be used.

	COM0	COM1	COM2	COM3	COM4	COM5	COM6	COM7	COM8	..	COM15
1/8	o	o	o	o	o	o	o	o	x	..	x
1/16	o	o	o	o	o	o	o	o	o	..	o

x:open,o:select

* SEG signal: The 60 segment signal pins are connected to the corresponding display RAM address 00h to 3Bh. The high byte and the low byte bit7 down to bit0 are correlated to COM15 to COM0 respectively .
When a bit of display RAM is 1, a select signal is sent to the corresponding segment pin, and when the bit is 0 , a non-select signal is sent to the corresponding segment pin.

*COM, SEG and Select/Non-select signal is shown as following:
