

## 1319T OC-192/STM-64 Lightwave Receiver

The 1319T 10 Gbits/s Receiver is manufactured in a compact, 14-pin butterfly-lead package with a single-mode optical fiber pigtail and a precision microwave coaxial connector for data access.

### Features

- High data rate capability: 10 Gbits/s
- APD or PIN photodetector
- Fully operational through the 1.3  $\mu\text{m}$  to 1.55  $\mu\text{m}$  wavelength range
- Typical sensitivity:
  - With PIN, -18 dBm
  - With APD, -26 dBm
- 23 dB typical dynamic range
- Single-mode fiber pigtail with FC/PC or SC optical connector
- Operating case temperature range:  
0  $^{\circ}\text{C}$  to 65  $^{\circ}\text{C}$
- 50  $\Omega$  ac-coupled data output
- Compact butterfly package with precision microwave *K Connector*\* for data output

### Applications

- Line terminal equipment
- High-speed networks up to 10 Gbits/s
- SONET OC-192 and SDH STM-64 telecommunications applications
- Extended-reach datacom and telecom applications
- Digital video

\* *K Connector* is a registered trademark of Wiltron Corporation.

**1319T OC-192/STM-64 Lightwave Receiver****Description****Receiver Operation**

The 1319T 10 Gbits/s fiber-optic receiver consists of a high-speed photodetector (APD or PIN) and a wide-band linear preamp in a pigtailed butterfly-lead metal package. It is designed for use in single-mode, high-speed telecommunication applications at the SONET OC-192 and the ITU-T SDH STM-64 data rate of 9.95328 Gbits/s.

At 10 Gbits/s, the typical room temperature sensitivity measured at a BER of  $3 \times 10^{-11}$  is  $-26$  dBm for the APD version of the receiver and  $-18$  dBm for the PIN version of the receiver. The operating case temperature range for the receiver is  $0^{\circ}\text{C}$  to  $65^{\circ}\text{C}$ .

The receiver is manufactured in a compact, 14-pin butterfly-lead package with a single-mode optical fiber pigtail and a precision microwave coaxial connector for data access. The fiber pigtail is internally beveled for low return loss and is available with *ST*<sup>®</sup>, *SC*, or *FC-PC* optical connectors.

The received data is ac-coupled ( $0.033\ \mu\text{F}$  capacitor) through a precision microwave coaxial *K Connector* manufactured by Wiltron Corp. This connector is mechanically and electrically compatible with standard SMA and 3.5 mm coaxial connectors but provides a lower return loss than the standard connectors. Other coaxial connectors will be available in the future.

The receiver requires  $+5\ \text{V}$  and  $-5\ \text{V}$  power supplies for operation. The photodiode also requires a separate bias voltage: for the PIN, a nominal bias of  $+5\ \text{V}$  at less than  $1\ \text{mA}$  is required; for the APD, a nominal bias of approximately  $+35\ \text{V}$  is required. The APD bias supply should be temperature compensated to match the  $0.2\ \%/^{\circ}\text{C}$  gain vs. temperature performance of the APD photodiode. The APD version of the receiver includes a  $3\ \text{k}\Omega$  thermistor which can be used to monitor receiver case temperature and also as the feedback element for a temperature-compensated bias supply for the APD.

The 700B power module available from the Lucent Technologies Power Systems Division is a dc-dc converter that converts  $+5\ \text{Vdc}$  to an adjustable high-voltage output in the range required for the APD bias. The 700B uses the thermistor in the 1319T to provide a temperature-compensated output. Contact your local Lucent sales office for pricing and delivery.

Also available from Maxim Integrated Products, Sunnyvale, CA are the MAX1771 and MAX774 dc-dc switching converter ICs which can be used to build a high-voltage APD bias supply.

**Pin Information****Table 1. Pin Descriptions**

Pin	Name
1	Ground
2	Photodiode bias
3	Ground
4	VEE ( $-5.2\ \text{V}$ )
5	Ground
6	Thermistor*
7	Ground
8	Ground
9	Ground
10	Ground
11	Ground
12	Ground
13	Vcc ( $5\ \text{V}$ )
14	No connect
CASE	Ground

\* The thermistor is not available in the PIN version of the receiver. In 1319P-Type receivers, this pin will be open circuit internally.

1-635.b

\* No connection for PIN versions (not connected internally).

**Figure 1. Pin Diagram**

## Handling Precautions

### Mounting and Connections

The pigtail consists of a 41 in.  $\pm$  13 in. (1041 mm  $\pm$  330 mm), 8  $\mu$ m core, single-mode fiber. The 1319P PIN receiver pigtails have a 900  $\mu$ m OD jacket diameter.

The 1319T APD models have a 1200  $\mu$ m OD jacket diameter. Both models of the receiver are available with FC/PC or SC optical connectors. Other connector options may be available. Contact your Lucent sales office for availability and ordering information.

The fiber bending radius during operation and storage is 1.5 in. (38 mm) minimum.

### Electrostatic Discharge

**CAUTION: This device is susceptible to damage as a result of electrostatic discharge (ESD). Take proper precautions during both handling and testing. Follow guidelines such as JEDEC Publication No. 108-A.**

Although protection circuitry is designed into the device, take proper precautions to avoid exposure to ESD. Lucent employs a human-body model (HBM) for ESD-susceptibility testing and protection design evaluation. ESD voltage thresholds are dependent on the critical parameters used to define the model. A standard HBM (resistance = 1.5 k $\Omega$ , capacitance = 100 pF) is widely used and, therefore, can be used for comparison purposes.

The HBM ESD withstand voltage established for the 1319-Type receiver is  $\pm$ 500 V.

### Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations section of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Supply Voltage:				
Positive Supply	VCC	0	5.8	V
Negative Supply	VEE	0	-5.8	V
Photodiode Supply Current:				
Forward*	—	—	20	mA
Reverse	—	—	2	mA
Optical Input Power:†				
APD	P <sub>MAX</sub>	—	2	dBm
PIN	P <sub>MAX</sub>	—	5	dBm
Operating Case Temperature	T <sub>C</sub>	0	65	°C
Storage Temperature	T <sub>C</sub>	-40	85	°C
Lead Soldering Temperature	—	—	250	°C
Lead Soldering Time	—	—	10	s

\* Device is normally reverse biased. Forward biasing the photodiode may compromise device performance and reliability.

† Under biased conditions. Unbiased, the maximum input optical power for both devices is +8 dBm.

### Qualification Tests

The 1319-Type receiver has successfully passed the following qualification tests and meets the intent of Bellcore TR-NWT-000468.

Test	Conditions	Sample Size	Failure Criteria
Physical Dimensions	MIL-STD-883C-2016	90	Visual
External Visual	MIL-STD-883C-2009.8	90	Visual
Impact Shock	1500 G, 5 hits, 6 axis, MIL-STD-883C-2002.3	11	Electrical/Optical
Variable Frequency Vibration	20 G, 10 Hz to 2 kHz, 4 cycles, 3 directions, 4 min./cycle, MIL-STD-883C-2007.1	11	Electrical/Optical
Solderability	MIL-STD-883C-2003.5	100%	Visual
Temperature Cycle	-10 °C to +60 °C, 2000 cycles, MIL-STD-883C-1010.7	15	Electrical/Optical
High Temperature, High Humidity with Bias	60 °C, 95% relative humidity, rated bias, 4000 hours	4	Electrical/Optical
High Temperature with Bias	60 °C ambient, rated bias, 4000 hours, MIL-STD-883C-1005.5	—	Electrical/Optical
Electrostatic Discharge	Human-body model (to determine class)	3	Electrical/Optical
Power Cycling	1500 cycles (30 min. on/off) MIL-STD-1006	3	Electrical/Optical

### Optical Characteristics

T<sub>A</sub> = 25 °C.

Parameter	Symbol	Min	Typ	Max	Unit
Optical Wavelength for Rated Sensitivity	$\lambda$	1.2	—	1.6	$\mu\text{m}$
Sensitivity (10 Gbits/s, $2^{23} - 1$ PRBS, $3 \times 10^{-11}$ BER):					
APD Version	PLOW	-22	-24	—	dBm
PIN Version	PLOW	-15	-18	—	dBm

\* The gain = 12 APD bias voltage at 25 °C is supplied with each device. For optimum performance, VAPD must be set within 50 mV of the specified value. VAPD needs to be temperature compensated to maintain constant gain over the operating temperature. The nominal compensation is 0.18%/°C.

† Transimpedance,  $TZ = \frac{V_{PP}}{I_{PH(AVG)}}$ , where IPH(AVG) is the average photodiode current.
