## 184 pin Unbuffered DDR DIMM

Based on DDR400/333/266 256M bit B Die device

### Features

- 184 Dual In-Line Memory Module (DIMM)
- Unbuffered DDR DIMM based on 256M bit die B device, organized as either 32Mbx8 or 16Mbx16
- Performance:

	PC3200	PC2700	PC2100	
Speed Sort	5T	6K	75B	Unit
DIMM $\overline{\text{CAS}}$ Latency	3	2.5	2.5	
$f_{\text{CK}}$ Clock Frequency	200	166	133	MHz
$t_{\text{CK}}$ Clock Cycle	5	6	7.5	ns
$f_{\text{DQ}}$ DQ Burst Frequency	400	333	266	MHz

- Intended for 133, 166 and 200 MHz applications
- Inputs and outputs are SSTL-2 compatible
- $V_{\text{DD}} = V_{\text{DDQ}} = 2.5\text{V} \pm 0.2\text{V}$  ( $2.6\text{V} \pm 0.1\text{V}$  for PC3200)
- SDRAMs have 4 internal banks for concurrent operation
- Differential clock inputs
- Data is read or written on both clock edges

- DRAM DLL aligns DQ and DQS transitions with clock transitions
- Address and control signals are fully synchronous to positive clock edge
- Programmable Operation:
  - DIMM  $\overline{\text{CAS}}$  Latency: 2, 2.5, 3
  - Burst Type: Sequential or Interleave
  - Burst Length: 2, 4, 8
  - Operation: Burst Read and Write
- Auto Refresh (CBR) and Self Refresh Modes
- Automatic and controlled precharge commands
- 7.8  $\mu\text{s}$  Max. Average Periodic Refresh Interval
- Serial Presence Detect EEPROM
- Gold contacts
- SDRAMs are packaged in TSOP packages
- "Green" packaging – lead free

### Description

NT512D64S8HB0G, NT512D64S8HB1G, NT512D64S8HB1GY, NT512D72S8PB0G, NT256D64SH88B0G, NT256D64SH88B1G, NT256D64SH88B1GY, NT256D72S89B0G and NT128D64SH4B1G are unbuffered 184-Pin Double Data Rate (DDR) Synchronous DRAM Dual In-Line Memory Modules (DIMM). NT512D64S8HB1GY and NT256D64SH88B1GY are packaged using lead free technology.

NT512D64S8HB0G, NT512D64S8HB1G and NT512D64S8HB1GY are 512MB modules organized as dual ranks using sixteen 32Mx8 TSOP devices. NT512D72S8PB0G has ECC and is organized as dual ranks using eighteen 32Mx8 TSOP devices. NT256D64SH88B0G, NT256D64SH88B1G and NT256D64SH88B1GY are 256MB modules organized as single rank using eight 32Mx8 TSOP devices. NT256D72S89B0G has ECC and is organized as single rank using nine 32Mx8 TSOP devices. NT128D64SH4B1G are 128MB modules, organized as single rank using four 16Mx16 TSOP devices.

Depending on the speed grade, these DIMMs are intended for use in applications operating up to 200 MHz clock speeds and achieves high-speed data transfer rates of up to 400 MHz. Prior to any access operation, the device  $\overline{\text{CAS}}$  latency and burst type/ length/operation type must be programmed into the DIMM by address inputs and I/O inputs BA0 and BA1 using the mode register set cycle.

The DIMM uses a serial EEPROM and through the use of a standard IIC protocol the serial presence-detect implementation (SPD) can be accessed. The first 128 bytes of the SPD data are programmed with the module characteristics as defined by JEDEC.

## Input/Output Functional Description

Symbol	Type	Polarity	Function
CK0, CK1, CK2, $\overline{\text{CK0}}, \overline{\text{CK1}}, \overline{\text{CK2}}$	(SSTL)	Cross point	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of CK. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.
CKE0, CKE1	(SSTL)	Active High	Activates the DDR SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refresh mode.
$\overline{\text{S0}}, \overline{\text{S1}}$	(SSTL)	Active Low	Enables the associated DDR SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Physical Bank 0 is selected by S0; Bank 1 is selected by S1.
$\overline{\text{RAS}}, \overline{\text{CAS}}, \overline{\text{WE}}$	(SSTL)	Active Low	When sampled at the positive rising edge of the clock, $\overline{\text{RAS}}, \overline{\text{CAS}}, \overline{\text{WE}}$ define the operation to be executed by the SDRAM.
$V_{\text{REF}}$	Supply		Reference voltage for SSTL-2 inputs
$V_{\text{DDQ}}$	Supply		Isolated power supply for the DDR SDRAM output buffers to provide improved noise immunity
BA0, BA1	(SSTL)	-	Selects which SDRAM bank is to be active.
A0 - A9 A10/AP A11, A12	(SSTL)	-	During a Bank Activate command cycle, A0-A12 defines the row address (RA0-RA12) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9 defines the column address (CA0-CA9) when sampled at the rising clock edge. In addition to the column address, AP is used to invoke auto-precharge operation at the end of the Burst Read or Write cycle. If AP is high, auto-precharge is selected and BA0/BA1 defines the bank to be precharged. If AP is low, auto-precharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0/BA1 to control which bank(s) to precharge. If AP is high all 4 banks will be precharged regardless of the state of BA0/BA1. If AP is low, then BA0/BA1 are used to define which bank to pre-charge.
DQ0 - DQ63	(SSTL)	-	Data and Check Bit input/output pins operate in the same manner as on conventional DRAMs.
DQS0 - DQS7, DQS9 - DQS16	(SSTL)	Active High	Data strobes: Output with read data, input with write data. Edge aligned with read data, centered on write data. Used to capture write data.
CB0 - CB7	(SSTL)	-	Data Check Bit Input/Output pins. Used on ECC modules and is not used on x64 modules.
DM0 - DM8	Input	Active High	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect. DM8 is associated with check bits CB0-CB7, and is not used on x64 modules.
$V_{\text{DD}}, V_{\text{SS}}$	Supply		Power and ground for the DDR SDRAM input buffers and core logic
SA0 - SA2		-	Address inputs. Connected to either $V_{\text{DD}}$ or $V_{\text{SS}}$ on the system board to configure the Serial Presence Detect EEPROM address.
SDA		-	This bi-directional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to $V_{\text{DD}}$ to act as a pull-up.
SCL		-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to $V_{\text{DD}}$ to act as a pull-up.
$V_{\text{DDSPD}}$	Supply		Serial EEPROM positive power supply.

## Absolute Maximum Ratings

Symbol	Parameter	Rating	Units
$V_{IN}, V_{OUT}$	Voltage on I/O pins relative to $V_{SS}$	-0.5 to $V_{DDQ} + 0.5$	V
$V_{IN}$	Voltage on Input relative to $V_{SS}$	-0.5 to +3.6	V
$V_{DD}$	Voltage on $V_{DD}$ supply relative to $V_{SS}$	-0.5 to +3.6	V
$V_{DDQ}$	Voltage on $V_{DDQ}$ supply relative to $V_{SS}$	-0.5 to +3.6	V
$T_A$	Operating Temperature (Ambient)	0 to +70	°C
$T_{STG}$	Storage Temperature (Plastic)	-55 to +150	°C
$P_D$	Power Dissipation (per device component)	1	W
$I_{OUT}$	Short Circuit Output Current	50	mA

**Note:** Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC Electrical Characteristics and Operating Conditions

$T_A = 0^\circ\text{C} \sim 70^\circ\text{C}$ ;  $V_{DDQ} = V_{DD} = 2.5V \pm 0.2V$  (PC2100, PC2700);  $T_A = 0^\circ\text{C} \sim 70^\circ\text{C}$ ;  $V_{DDQ} = V_{DD} = 2.6V \pm 0.1V$  (PC3200)

Symbol	Parameter		Min	Max	Units	Notes
V <sub>DD</sub>	Supply Voltage	PC2100, PC2700	2.3	2.7	V	1
		PC3200	2.5			
V <sub>DDQ</sub>	I/O Supply Voltage	PC2100, PC2700	2.3	2.7	V	1
		PC3200	2.5			
V <sub>SS</sub> , V <sub>SSQ</sub>	Supply Voltage, I/O Supply Voltage		0	0	V	
V <sub>REF</sub>	I/O Reference Voltage		0.49 x V <sub>DDQ</sub>	0.51 x V <sub>DDQ</sub>	V	1, 2
V <sub>TT</sub>	I/O Termination Voltage (System)		V <sub>REF</sub> – 0.04	V <sub>REF</sub> + 0.04	V	1, 3
V <sub>IH</sub> (DC)	Input High (Logic1) Voltage		V <sub>REF</sub> + 0.15	V <sub>DDQ</sub> + 0.3	V	1
V <sub>IL</sub> (DC)	Input Low (Logic0) Voltage		-0.3	V <sub>REF</sub> - 0.15	V	1
V <sub>IN</sub> (DC)	Input Voltage Level, CK and $\overline{CK}$ Inputs		-0.3	V <sub>DDQ</sub> + 0.3	V	1
V <sub>ID</sub> (DC)	Input Differential Voltage, CK and $\overline{CK}$ Inputs		0.30	V <sub>DDQ</sub> + 0.6	V	1, 4
I <sub>I</sub>	Input Leakage Current					
	Any input 0V ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> ;		-10	10	μA	1
	All other pins not under test = 0V					
I <sub>OZ</sub>	Output Leakage Current		-10	10	μA	1
	DQs are disabled; 0V ≤ V <sub>out</sub> ≤ V <sub>DDQ</sub>					
I <sub>OH</sub>	Output High Current (V <sub>OUT</sub> = V <sub>DDQ</sub> -0.373V, min V <sub>REF</sub> , min V <sub>TT</sub> )		-16.8	-	mA	1
I <sub>OL</sub>	Output Low Current (V <sub>OUT</sub> = 0.373, max V <sub>REF</sub> , max V <sub>TT</sub> )		16.8	-	mA	1

- Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
- $V_{REF}$  is expected to be equal to  $0.5 V_{DDQ}$  of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on  $V_{REF}$  may not exceed 2% of the DC value.
- $V_{TT}$  is not applied directly to the DIMM.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$ .
- $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .

## AC Characteristics

Notes 1-5 apply to the following Tables; Electrical Characteristics and DC Operating Conditions, AC Operating Conditions, Operating, Standby, and Refresh Currents, and Electrical Characteristics and AC Timing.)

1. All voltages referenced to  $V_{SS}$ .
2. Tests for AC timing, IDD, and electrical, AC and DC characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. Outputs measured with equivalent load. Refer to the AC Output Load Circuit below.
4. AC timing and IDD tests may use a  $V_{IL}$  to  $V_{IH}$  swing of up to 1.5V in the test environment, but input timing is still referenced to  $V_{REF}$  (or to the crossing point for CK,  $\overline{CK}$ ), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals is 1V/ns in the range between  $V_{IL(AC)}$  and  $V_{IH(AC)}$  unless otherwise specified.
5. The AC and DC input level specifications are as defined in the SSTL\_2 Standard (i.e. the receiver effectively switches as a result of the signal crossing the AC input level, and remains in that state as long as the signal does not ring back above (below) the DC input LOW (HIGH) level.

## AC Output Load Circuits

## AC Operating Conditions

$T_A = 0^\circ\text{C} \sim 70^\circ\text{C}$ ;  $V_{DDQ} = V_{DD} = 2.5V \pm 0.2V$  (PC2100/PC2700);  $V_{DDQ} = V_{DD} = 2.6V \pm 0.1V$  (PC3200)

Symbol	Parameter/Condition	Min	Max	Unit	Notes
$V_{IH(AC)}$	Input High (Logic 1) Voltage.	$V_{REF} + 0.31$		V	1, 2
$V_{IL(AC)}$	Input Low (Logic 0) Voltage.		$V_{REF} - 0.31$	V	1, 2
$V_{ID(AC)}$	Input Differential Voltage, CK and $\overline{CK}$ Inputs	0.62	$V_{DDQ} + 0.6$	V	1, 2, 3
$V_{IX(AC)}$	Input Differential Pair Cross Point Voltage, CK and $\overline{CK}$ Inputs	$(0.5 * V_{DDQ}) - 0.2$	$(0.5 * V_{DDQ}) + 0.2$	V	1, 2, 4

1. Input slew rate = 1V/ ns.
2. Inputs are not recognized as valid until  $V_{REF}$  stabilizes.
3.  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
4. The value of  $V_{IX}$  is expected to equal  $0.5 * V_{DDQ}$  of the transmitting device and must track variations in the DC level of the same.

$t_{REFI}$	Average Periodic Refresh Interval		7.8		7.8		7.8	$\mu\text{s}$	1-4, 8

## AC Timing Specification Notes

- Input slew rate = 1V/ns.
- The CK/ $\overline{\text{CK}}$  input reference level (for timing reference to CK/ $\overline{\text{CK}}$ ) is the point at which CK and  $\overline{\text{CK}}$  cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$  is  $V_{\text{REF}}$ .
- Inputs are not recognized as valid until  $V_{\text{REF}}$  stabilizes.
- The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (Note 3) is  $V_{\text{TT}}$ .
- $t_{\text{HZ}}$  and  $t_{\text{LZ}}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
- The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- The specific requirement is that DQS be valid (high, low, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from high to low at this time, depending on  $t_{\text{DQSS}}$ .
- A maximum of eight Auto refresh commands can be posted to any given DDR SDRAM device.
- For command/address input slew rate  $\geq 1.0$  V/ns. Slew rate is measured between  $V_{\text{OH (AC)}}$  and  $V_{\text{OL (AC)}}$ .
- For command/address input slew rate  $\geq 0.5$  V/ns and  $< 1.0$  V/ns. Slew rate is measured between  $V_{\text{OH (AC)}}$  and  $V_{\text{OL (AC)}}$ .
- CK/ $\overline{\text{CK}}$  slew rates are  $\geq 1.0$  V/ns.
- These parameters guarantee device timing, but they are not necessarily tested on each device, and they may be guaranteed by design or tester characterization.
- For each of the terms in parentheses, if not already an integer, round to the next highest integer.  $t_{\text{CK}}$  is equal to the actual system clock cycle time. For example, for PC2100 at CL= 2.5,  $t_{\text{DAL}} = (15\text{ns}/7.5\text{ns}) + (20\text{ns}/7.0\text{ns}) = 2 + 3 = 5$ .
- An input setup and hold time derating table is used to increase  $t_{\text{IS}}$  and  $t_{\text{IH}}$  in the case where the input slew rate is below 0.5 V/ns.

Input Slew Rate	Delta ( $t_{\text{IS}}$ )	Delta ( $t_{\text{IH}}$ )	Unit	Note
0.5 V/ns	0	0	ps	1, 2
0.4 V/ns	+50	0	ps	1, 2
0.3 V/ns	+100	0	ps	1, 2

- Input slew rate is based on the lesser of the slew rates determined by either  $V_{\text{IH (AC)}}$  to  $V_{\text{IL (AC)}}$  or  $V_{\text{IH (DC)}}$  to  $V_{\text{IL (DC)}}$ , similarly for rising transitions.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.

- An input setup and hold time derating table is used to increase  $t_{\text{DS}}$  and  $t_{\text{DH}}$  in the case where the I/O slew rate is below 0.5 V/ns.

Input Slew Rate	Delta ( $t_{\text{DS}}$ )	Delta ( $t_{\text{DH}}$ )	Unit	Note
0.5 V/ns	0	0	ps	1, 2
0.4 V/ns	+75	+75	ps	1, 2
0.3 V/ns	+150	+150	ps	1, 2

- I/O slew rate is based on the lesser of the slew rates determined by either  $V_{\text{IH (AC)}}$  to  $V_{\text{IL (AC)}}$  or  $V_{\text{IH (DC)}}$  to  $V_{\text{IL (DC)}}$ , similarly for rising transitions.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.

- An I/O Delta Rise, Fall Derating table is used to increase  $t_{\text{DS}}$  and  $t_{\text{DH}}$  in the case where DQ, DM, and DQS slew rates differ.

Delta Rise and Fall Rate	Delta ( $t_{\text{DS}}$ )	Delta ( $t_{\text{DH}}$ )	Unit	Note
0.0 ns/V	0	0	ps	1-4
0.25 ns/V	+50	+50	ps	1-4
0.5 ns/V	+100	+100	ps	1-4

- Input slew rate is based on the lesser of the slew rates determined by either  $V_{\text{IH (AC)}}$  to  $V_{\text{IL (AC)}}$  or  $V_{\text{IH (DC)}}$  to  $V_{\text{IL (DC)}}$ , similarly for rising transitions.
- Input slew rate is based on the larger of AC to AC delta rise, fall rate and DC to DC delta rise, fall rate.
- The delta rise, fall rate is calculated as:  $[1/(\text{slew rate } 1)] - [1/(\text{slew rate } 2)]$   
For example: slew rate 1 = 0.5 V/ns; slew rate 2 = 0.4 V/ns. Delta rise, fall =  $(1/0.5) - (1/0.4)$  [ns/V] = -0.5 ns/V  
Using the table above, this would result in an increase in  $t_{\text{DS}}$  and  $t_{\text{DH}}$  of 100 ps.
- These derating parameters may be guaranteed by design or tester characterization and are not necessarily tested on each device.
