

# STK15C88

## 32K x 8 *AutoStore*<sup>TM</sup> nvSRAM

### High Performance CMOS

### Nonvolatile Static RAM

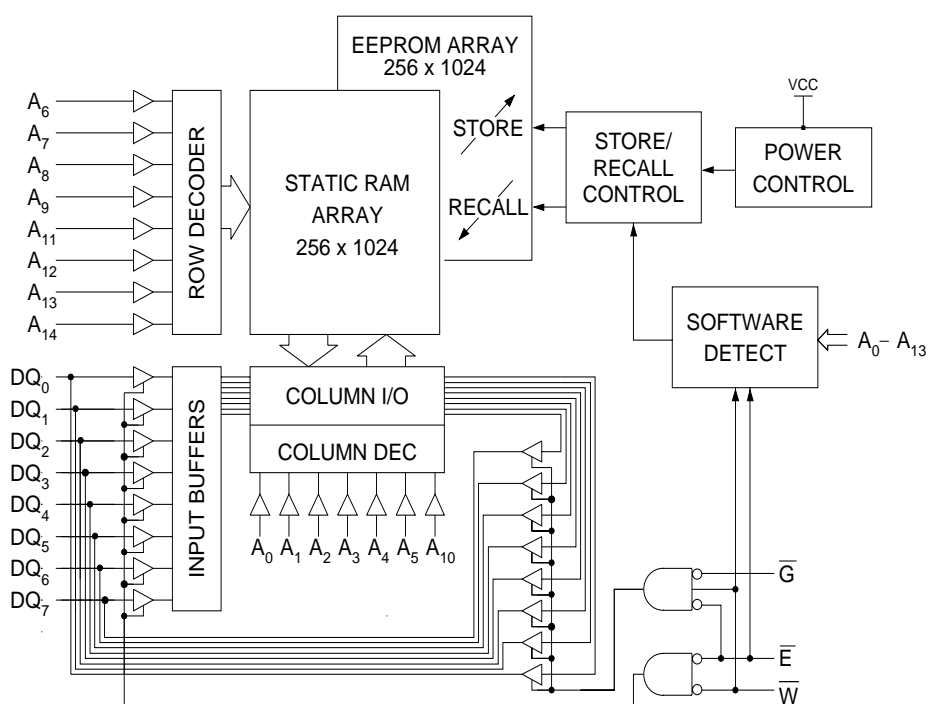

#### FEATURES

- Nonvolatile Storage Without Battery Problems
- Directly Replaces 32K x 8 static RAM, Battery Backed RAM or EEPROM
- 25ns, 35ns and 45ns Access Times
- Store to EEPROM Initiated by Software or *AutoStore*<sup>TM</sup> on Power Down
- Recall to SRAM by Software or Power Restore
- 15mA  $I_{CC}$  at 200ns Cycle Time
- Unlimited Read, Write and Recall Cycles
- 1,000,000 Store Cycles to EEPROM
- 100 Year Data Retention Over Full Industrial Temperature Range
- Commercial and Industrial Temp. Ranges
- 28 Pin 600 or 300 mil PDIP and 350 mil SOIC

#### DESCRIPTION

The Simtek STK15C88 is a fast static RAM with a nonvolatile, electrically-erasable PROM element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent, nonvolatile data resides in EEPROM. Data transfers from the SRAM to the EEPROM (the *STORE* operation) can take place automatically on power down using charge stored in system capacitance. Transfers from the EEPROM to the SRAM (the *RECALL* operation) take place automatically on restoration of power. Initiation of STORE and RECALL cycles can also be controlled by entering control sequences on the SRAM inputs.

#### BLOCK DIAGRAM

#### PIN CONFIGURATIONS

28 - 300 PDIP  
28 - 600 PDIP  
28 - 350 SOIC  
28 - 300 SOIC

#### PIN NAMES

$A_0 - A_{14}$	Address Inputs
$\bar{W}$	Write Enable
$DQ_0 - DQ_7$	Data In/Out
$\bar{E}$	Chip Enable
$\bar{G}$	Output Enable
$V_{CC}$	Power (+5V)
$V_{SS}$	Ground

## ABSOLUTE MAXIMUM RATINGS<sup>a</sup>

Voltage on input relative to $V_{SS}$ . . . . .	-0.6V to ( $V_{CC} + 0.5V$ )
Voltage on $DQ_{0-7}$ . . . . .	-0.5V to ( $V_{CC} + 0.5V$ )
Temperature under bias . . . . .	-55°C to 125°C
Storage temperature . . . . .	-65°C to 150°C
Power dissipation . . . . .	1W
DC output current . . . . .	15mA

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## DC CHARACTERISTICS

( $V_{CC} = 5.0V \pm 10\%$ )

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
$I_{CC1}^b$	Average Current		95 75 65		100 80 70	mA	$t_{AVAV} = 25ns$ $t_{AVAV} = 35ns$ $t_{AVAV} = 45ns$
$I_{CC2}^c$	Average Current During STORE		6		7	mA	All inputs Don't Care
$I_{CC3}^b$	Average VCC Current at $t_{AVAV} = 200ns$		15		15	mA	$\bar{W} \geq (V_{CC} - 0.2V)$ All others cycling, CMOS levels
$I_{CC4}^c$	Average Current During <i>AutoStore</i> <sup>TM</sup> Cycle		4		4	mA	All inputs Don't Care
$I_{SB1}^d$	Average Current (Standby, Cycling TTL Input Levels)		29 24 20		30 25 21	mA	$t_{AVAV} = 25ns, \bar{E} \geq V_{IH}$ $t_{AVAV} = 35ns, \bar{E} \geq V_{IH}$ $t_{AVAV} = 45ns, \bar{E} \geq V_{IH}$
$I_{SB2}^d$	Standby Current (Standby, Stable CMOS Input Levels)		3		3	mA	$\bar{E} \geq (V_{CC} - 0.2V)$ All others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
$I_{ILK}$	Input Leakage Current		$\pm 1$		$\pm 1$	$\mu A$	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to $V_{CC}$
$I_{OLK}$	Off-State Output Leakage Current		$\pm 5$		$\pm 5$	$\mu A$	$V_{CC} = \max$ $V_{IN} = V_{SS}$ to $V_{CC}$ , $\bar{E}$ or $\bar{G} \geq V_{IH}$
$V_{IH}$	Input Logic "1" Voltage	2.2	$V_{CC} + .5$	2.2	$V_{CC} + .5$	V	All inputs
$V_{IL}$	Input Logic "0" Voltage	$V_{SS} - .5$	0.8	$V_{SS} - .5$	0.8	V	All inputs
$V_{OH}$	Output Logic "1" Voltage	2.4		2.4		V	$I_{OUT} = -4mA$
$V_{OL}$	Output Logic "0" Voltage		0.4		0.4	V	$I_{OUT} = 8mA$
$T_A$	Operating Temperature	0	70	-40	85	°C	

Note b:  $I_{CC1}$  and  $I_{CC3}$  are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.

Note c:  $I_{CC2}$  and  $I_{CC4}$  are the average currents required for the duration of the respective *STORE* cycles ( $t_{STORE}$ ).

Note d:  $\bar{E} \geq V_{IH}$  will not produce standby current levels until any nonvolatile cycle in progress has timed out.

## AC TEST CONDITIONS

Input pulse levels . . . . .	0V to 3V
Input rise and fall times . . . . .	$\leq 5ns$
Input and output timing reference levels . . . . .	1.5V
Output load . . . . .	See Figure 1

## CAPACITANCE<sup>e</sup> ( $T_A = 25^\circ C$ , $f = 1.0MHz$ )

SYMBOL	PARAMETER	MAX	UNITS	CONDITIONS
$C_{IN}$	Input capacitance	5	pF	$\Delta V = 0$ to 3V
$C_{OUT}$	Output capacitance	7	pF	$\Delta V = 0$ to 3V

Note e: These parameters are guaranteed but not tested.

Note n: The software sequence is clocked with  $\overline{E}$  controlled reads.  
Note o: The six consecutive addresses must be in the order listed in the SOFTWARE MODE SELECTION Table - (0E38, 31C7, 03E0, 3C1F, 303F, 0FC0) for a *STORE* cycle or (0E38, 31C7, 03E0, 3C1F, 303F, 0C63) for a *RECALL* cycle.  $\overline{W}$  must be high during all six consecutive cycles.

SOFTWARE CYCLE:  $\overline{E}$  CONTROLLED

## DEVICE OPERATION

The STK15C88 is a versatile memory chip that provides several modes of operation. The STK15C88 can operate as a standard 32K x 8 SRAM. It has a 32K x 8 EEPROM shadow to which the SRAM information can be copied, or from which the SRAM can be updated in nonvolatile mode.

### NOISE CONSIDERATIONS

Note that the STK15C88 is a high speed memory and so must have a high frequency bypass capacitor of approximately 0.1 $\mu$ F connected between DUT  $V_{CC}$  and  $V_{SS}$ , using leads and traces that are as short as possible. As with all high speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

### SRAM READ

The STK15C88 performs a READ cycle whenever  $\overline{E}$  and  $\overline{G}$  are low and  $\overline{W}$  is high. The address specified on pins  $A_{0-14}$  determines which of the 32,768 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of  $t_{AVQV}$  (READ CYCLE #1). If the READ is initiated by  $\overline{E}$  or  $\overline{G}$ , the outputs will be valid at  $t_{ELQV}$  or at  $t_{GLQV}$ , whichever is later (READ CYCLE #2). The data outputs will repeatedly respond to address changes within the  $t_{AVQV}$  access time without the need for transitions on any control input pins, and will remain valid until another address change or until  $\overline{E}$  or  $\overline{G}$  is brought high.

### SRAM WRITE

A WRITE cycle is performed whenever  $\overline{E}$  and  $\overline{W}$  are low. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\overline{E}$  or  $\overline{W}$  goes high at the end of the cycle. The data on the common I/O pins  $DQ_{0-7}$  will be written into the memory if it is valid  $t_{DVWH}$  before the end of a  $\overline{W}$  controlled WRITE or  $t_{DVEH}$  before the end of an  $\overline{E}$  controlled WRITE.

It is recommended that  $\overline{G}$  be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If  $\overline{G}$  is left low, internal circuitry will turn off the output buffers  $t_{WLQZ}$  after  $\overline{W}$  goes low.

### SOFTWARE NONVOLATILE STORE

The STK15C88 software STORE cycle is initiated by executing sequential READ cycles from six specific address locations. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. The program operation copies the SRAM data into nonvolatile memory. Once a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of reads from specific addresses is used for STORE initiation, it is important that no other READ or WRITE accesses intervene in the sequence or the sequence will be aborted and no STORE or RECALL will take place.

To initiate the software STORE cycle, the following READ sequence must be performed:

1. Read address	0E38 (hex)	Valid READ
2. Read address	31C7 (hex)	Valid READ
3. Read address	03E0 (hex)	Valid READ
4. Read address	3C1F (hex)	Valid READ
5. Read address	303F (hex)	Valid READ
6. Read address	0FC0 (hex)	Initiate STORE cycle

The software sequence is clocked with  $\overline{E}$  controlled reads.

Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that  $\overline{G}$  be low for the sequence to be valid. After the  $t_{STORE}$  cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

### SOFTWARE NONVOLATILE RECALL

A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of READ operations must be performed:

1. Read address	0E38 (hex)	Valid READ
2. Read address	31C7 (hex)	Valid READ
3. Read address	03E0 (hex)	Valid READ
4. Read address	3C1F (hex)	Valid READ
5. Read address	303F (hex)	Valid READ
6. Read address	0C63 (hex)	Initiate RECALL cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared and second, the nonvolatile information is transferred into the SRAM cells. After the  $t_{\text{RECALL}}$  cycle time the SRAM will once again be ready for READ and WRITE operations. The RECALL operation in no way alters the data in the EEPROM cells. The nonvolatile data can be recalled an unlimited number of times.

## AutoStore™ OPERATION

The STK15C88 uses the intrinsic system capacitance to perform an automatic store on power down. As long as the system power supply takes at least  $t_{\text{STORE}}$  to decay from  $V_{\text{SWITCH}}$  down to 3.6V the STK15C88 will safely and automatically store the SRAM data in EEPROM on power-down.

In order to prevent unneeded STORE operations, automatic STORE will be ignored unless at least one WRITE operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a WRITE operation has taken place.

## POWER UP RECALL

During power up, or after any low power condition ( $V_{\text{CC}} < V_{\text{RESET}}$ ) an internal recall request will be latched. When  $V_{\text{CC}}$  once again exceeds the sense

voltage of  $V_{\text{SWITCH}}$ , a RECALL cycle will automatically be initiated and will take  $t_{\text{RESTORE}}$  to complete.

## HARDWARE PROTECT

The STK15C88 offers hardware protection against inadvertent STORE operation during low voltage conditions. When  $V_{\text{CC}} < V_{\text{SWITCH}}$  all Software STORE operations will be inhibited.

## LOW AVERAGE ACTIVE POWER

The STK15C88 draws significantly less current when it is cycled at times longer than 30ns. *Figure 2*, below, shows the relationship between  $I_{\text{CC}}$  and READ cycle time. Worst case current consumption is shown for both CMOS and TTL input levels (commercial temperature range,  $V_{\text{CC}} = 5.5\text{V}$ , 100% duty cycle on chip enable). *Figure 3* shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the STK15C88 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READ's to WRITE's; 5) the operating temperature; 6) the  $V_{\text{CC}}$  level and; 7) I/O loading.

Fig 2: Icc (max) Reads

Fig 3: Icc (Max) Writes

## ORDERING INFORMATION

**STK15C88 - W 25 I**

### Temperature Range

blank = Commercial (0 to 70 degrees C)

I = Industrial (-40 to 85 degrees C)

### Access Time

25 = 25ns

35 = 35ns

45 = 45ns

### Package

W = Plastic 28 pin 600 mil DIP

P = Plastic 28 pin 300 mil DIP

S = Plastic 28 pin 350 mil SOIC

N = Plastic 28 pin 300 mil SOIC
