Dual P-Channel Enhancement Mode Field Effect Transistor

General Description

These P-Channel enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance, provide superior switching performance, and withstand high energy pulses in the avalanche and commutation modes. These devices are particularly suited for low voltage applications such as notebook computer power management and other battery powered circuits where fast switching, low in-line power loss, and resistance to transients are needed.

Features

- -3.8A, -20V. $R_{DS(ON)} = 0.07\Omega$ @ $V_{GS} = -4.5V$
 $R_{DS(ON)} = 0.1\Omega$ @ $V_{GS} = -2.7V$.
- High density cell design for extremely low $R_{DS(ON)}$.
- High power and current handling capability in a widely used surface mount package.
- Dual MOSFET in surface mount package.

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$ unless otherwise noted

Notes:

1. R_{θJA} is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. R_{θJC} is guaranteed by design while R_{θCA} is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\theta JA}(t)} = \frac{T_J - T_A}{R_{\theta J} + R_{\theta CA}(t)} = I_D^2(t) \times R_{DS(on)} @ T_J$$

Typical R_{θJA} for single device operation using the board layouts shown below on 4.5"x5" FR-4 PCB in a still air environment:

- a. 78°C/W when mounted on a 0.5 in² pad of 2oz copper.
- b. 125°C/W when mounted on a 0.02 in² pad of 2oz copper.
- c. 135°C/W when mounted on a 0.003 in² pad of 2oz copper.
