## F<sup>2</sup>MC<sup>®</sup>-16LX MB90335 Series

### MB90337/F337/V330A

#### ■ DESCRIPTION

The MB90335 series are 16-bit microcontrollers designed for applications, such as personal computer peripheral devices, that require USB communications. The USB feature supports not only 12-Mbps Function operation but also MiniHost operation. It is equipped with functions that are suitable for personal computer peripheral devices such as displays and audio devices, and control of mobile devices that support USB communications. While inheriting the AT architecture of the F<sup>2</sup>MC\* family, the instruction set supports the C language and extended addressing modes and contains enhanced signed multiplication and division instructions as well as a substantial collection of improved bit manipulation instructions. In addition, long word processing is now available by introducing a 32-bit accumulator.

\* : F<sup>2</sup>MC stands for FUJITSU Flexible Microcontroller, a registered trademark of FUJITSU LIMITED.

#### ■ FEATURES

##### ● Clock

- Built-in oscillation circuit and PLL clock frequency multiplication circuit
- Oscillation clock  
The machine clock is the oscillation clock divided into 2 (for oscillation 6 MHz : 3 MHz)  
Clock for USB is 48 MHz  
Machine clock frequency of 6 MHz, 12 MHz or 24 MHz selectable
- Minimum execution time of instruction : 41.6 ns (6 MHz oscillation clock, 4-time multiplied : machine clock 24 MHz and at operating V<sub>CC</sub> = 3.3 V)

##### ● The maximum memory space:16 MB

- 24-bit addressing
- Bank addressing

(Continued)

#### ■ PACKAGE

64-pin plastic LQFP

(FPT-64P-M09)

(Continued)

- **Instruction system**

- Data types: Bit, Byte, Word, Long word
  - Addressing mode (23 types)
  - Enhanced high-precision computing with 32-bit accumulator
  - Enhance Multiply/Divide instructions with sign and the RETI instruction

- **Instruction system compatible with high-level language (C language) and multitask**

- Employing system stack pointer
  - Instruction set symmetry and barrel shift instructions

- **Program Patch Function (2 address pointer)**

- **4-byte instruction queue**

- **Interrupt function**

- Priority levels are programmable
  - 20 interrupts

- **Data transfer function**

- Expanded intelligent I/O service function (EI<sup>2</sup>OS) : Maximum of 16 channels
  - $\mu$ DMAC : Maximum 16 channels

- **Low Power Consumption Mode**

- Sleep mode (with the CPU operating clock stopped)
  - Time - base timer mode (with the oscillator clock and time - base timer operating)
  - Stop mode (with the oscillator clock stopped)
  - CPU intermittent operation mode (with the CPU operating at fixed intervals of set cycles)

- **Package**

- LQFP-64P (FPT-64P-M09 : 0.65 mm pin pitch)

- **Process : CMOS technology**

- **Operation guaranteed temperature: -40 °C to +85 °C (0 °C to +70 °C when USB is in use)**

## ■ INTERNAL PERIPHERAL FUNCTION (RESOURCE)

- **I/O port: Max 45 ports**
- **Time-base timer : 1channel**
- **Watchdog timer : 1 channel**
- **16-bit reload timer : 1 channel**
- **Multi-functional timer**
  - 8/16-bit PPG timer (8-bit × 4 channels or 16-bit × 2 channels) the period and duty of the output pulse can be set by the program.
  - 16-bit PWC timer : 1 channel  
Timer function and pulse width measurement function
- **UART : 2 channels**
  - Equipped with Full duplex double buffer with 8-bit length
  - Asynchronous transfer or clock-synchronous serial (I/O extended serial) transfer can be set.
- **Extended I/O serial interface: 1 channel**
- **DTP/External interrupt circuit (8 channels)**
  - Activate the extended intelligent I/O service by external interrupt input
  - Interrupt output by external interrupt input
- **Delayed interrupt output module**
  - Output an interrupt request for task switching
- **USB : 1 channel**
  - USB function (conform to USB 2.0 Full Speed)
  - Supports for Full Speed/Endpoint are specifiable up to six.
  - Dual port RAM (The FIFO mode is supported).
  - Transfer type: Control, Interrupt, Bulk or Isochronous transfer possible
  - USB Mini Host function
- **I<sup>2</sup>C Interface : 1 channel**
  - Supports Intel SM bus standards and Phillips I<sup>2</sup>C bus standards
  - Two-wire data transfer protocol specification
  - Master and slave transmission/reception

Note : I<sup>2</sup>C licenae :

Purchase of Fujitsu I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use, these components in an I<sup>2</sup>C system provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Phillips.

## ■ PRODUCT LINEUP

### 1. MB90335 Series

Part number	MB90V330A	MB90F337	MB90337
Type	For evaluation	Built-in FLASH MEMORY	Built-in Mask ROM
ROM capacity	No	64 Kbyte	
RAM capacity	28 Kbyte	4 Kbyte	
Emulator-specific power supply *	Used bit	—	
CPU functions	Number of basic instructions : 351 instructions Minimum instruction execution time : 41.6 ns / at oscillation of 6 MHz (When 4 times is used : Machine clock of 24 MHz) Addressing type : 23 types Program Patch Function : For two address pointers maximum memory space : 16 Mbyte		
Ports	I/O Ports(CMOS) 45 ports		
UART	Equipped with full-duplex double buffer Clock synchronous or asynchronous operation selectable. It can also be used for I/O serial. Built-in special baud-rate generator Built-in 2 channels		
16-bit reload timer	16-bit reload timer operation Built-in 1 channel		
Multi-functional timer	8/16-bit PPG timer (8-bit mode × 4 channels, 16-bit mode × 2 channels) 16-bit PWC timer × 1 channel		
DTP/External interrupt	8 channels Interrupt factor : “L”→“H” edge /“H”→“L” edge /“L” level /“H” level selectable		
I <sup>2</sup> C	1 channel		
Extended I/O serial interface	1 channel		
USB	1 channel USB function (conform to USB 2.0 Full Speed) USB Mini-HOST function		
Withstand voltage of 5 V	6 ports (Excluding VBUS and I/O for I <sup>2</sup> C)		
Low Power Consumption Mode	Sleep mode/Timebase timer mode/Stop mode/CPU intermittent mode		
Process	CMOS		
Operating voltage VCC	3.3 V ± 0.3 V (at maximum machine clock 24 MHz)		

\* : It is setting of Jumper switch (TOOL VCC) when Emulator (MB2147-01) is used. Please refer to the MB2147-01 or MB2147-20 hardware manual (3.3 Emulator-dedicated Power Supply Switching) about details.

## ■ PACKAGES AND PRODUCT MODELS

Package	MB90337	MB90F337	MB90V330A
FPT-64P-M09 (LQFP-0.65 mm)	○	○	×
PGA-299C-A01 (PGA)	×	×	○

○ : Yes    × : No

Note : For detailed information on each package, see “■ PACKAGE DIMENSIONS”.

## PIN ASSIGNMENT

## ■ PIN DESCRIPTION

Pin no.	Pin name	Circuit type*	Status at reset/ function	Function
QFPM09				
46 , 47	X0, X1	A	Oscillation status	It is a terminal which connects the oscillator. When connecting an external clock, leave the X1 pin side unconnected.
23	$\overline{\text{RST}}$	F	Reset input	External reset input pin.
25 to 32	P00 to P07	I	Port input (High-Z)	General purpose input/output port. The ports can be set to be added with a pull-up resistor (RD00 to RD07 = 1) by the pull-up resistor setting register (RDR0). (When the power output is set, it is invalid.)
33 to 40	P10 to P17	I		General purpose input/output port. The ports can be set to be added with a pull-up resistor (RD10 to RD17 = 1) by the pull-up resistor setting register (RDR1). (When the power output is set, it is invalid.)
41 to 44	P20 to P23	D		General purpose input/output port.
45	P24	D		General purpose input/output port.
	PPG0			Functions as output pins of PPG timers ch0.
51 to 53	P25 to P27	D		General purpose input/output port.
	PPG1 to PPG3			Functions as output pins of PPG timers ch1 to ch3.
62	P40	H		General purpose input/output port.
	TIN0			Function as event input pin of 16-bit reload timer.
63	P41	H		General purpose input/output port.
	TOT0			Function as output pin of 16-bit reload timer.
11	P42	H		General purpose input/output port.
	SIN0			Functions as a data input pin for UART ch0.
12	P43	H		General purpose input/output port.
	SOT0			Functions as a data output pin for UART ch0.
13	P44	H		General purpose input/output port.
	SCK0			Functions as a clock I/O pin for UART ch0.
14	P45	H		General purpose input/output port.
	SIN1			Functions as a data input pin for UART ch1.
15	P46	H		General purpose input/output port.
	SOT1			Functions as a data output pin for UART ch1.
16	P47	H		General purpose input/output port.
	SCK1			Functions as a clock I/O pin for UART ch1.
50	P50	K		General purpose input/output port.
64	P51	K		General purpose input/output port.
17, 18	P52, P53	K		General purpose input/output port.
24	P54	K		General purpose input/output port.

\* : For circuit information, see “■ I/O CIRCUIT TYPE”.

(Continued)

(Continued)

Pin no.	Pin name	Circuit type*	Status at reset/ function	Function
QFPM09				
54, 55	P60, P61	C	Port input (High-Z)	General purpose input/output port. (withstand voltage of 5 V)
	INT0, INT1			Functions as the input pin for external interrupt ch0 and ch1.
56	P62	C		General purpose input/output port. (withstand voltage of 5 V)
	INT2			Functions as the input pin for external interrupt ch2.
	SIN			Data input pin for simple serial IO.
57	P63	C		General purpose input/output port. (withstand voltage of 5 V)
	INT3			Functions as the input pin for external interrupt ch3.
	SOT			Data output pin for simple serial IO
58	P64	C		General purpose input/output port. (withstand voltage of 5 V)
	INT4			Functions as the input pin for external interrupt ch4.
	SCK			Clock I/O pin for simple serial IO.
59	P65	C		General purpose input/output port. (withstand voltage of 5 V)
	INT5			Functions as the input pin for external interrupt ch5.
	PWC			Functions as the PWC input pin.
60	P66	C		General purpose input/output port.
	INT6			Functions as the input pin for external interrupt ch6.
	SCL0			Functions as the input/output pin for I <sup>2</sup> C interface clock. The port output must be placed in High-Z state during I <sup>2</sup> C interface operation.
61	P67	C		General purpose input/output port.
	INT7			Functions as the input pin for external interrupt ch7.
	SDA0			Functions as the I <sup>2</sup> C interface data input/output pin. The port out-put must be placed in High-Z state during I <sup>2</sup> C interface operation.
1	VBUS	C	VBUS input	Status detection pin of USB cable.
3	DVM	J	USB input (SUSPEND)	USB function D – pin.
4	DVP	J		USB function D + pin.
7	HVM	J		USB Mini Host D – pin.
8	HVP	J		USB Mini Host D + pin.
10	HCONX	E	High output	External pull-up resistor connection pin.
21, 22	MD1, MD0	B	Mode input Pin	Input pin for selecting operation mode.
20	MD2	G		
5	Vcc	—	Power supply	Power supply pin.
9	Vcc	—		Power supply pin.
49	Vcc	—		Power supply pin.
2	Vss	—		Power supply pin (GND).
6	Vss	—		Power supply pin (GND).
19	Vss	—		Power supply pin (GND).
48	Vss	—		Power supply pin (GND).

\* : For circuit information, see “■ I/O CIRCUIT TYPE”.

## ■ HANDLING DEVICES

### 1. Preventing latchup and turning on power supply

Latchup may occur on CMOS IC under the following conditions:

1. If a voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to input and output pins.
2. A voltage higher than the rated voltage is applied between  $V_{CC}$  and  $V_{SS}$ .

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using CMOSICs, take great care to prevent the occurrence of latchup.

### 2. Treatment of unused pins

Leaving unused input pins open may cause a malfunction. These pins must therefore be set to a pull-up or pull-down state.

### 3. About the attention when the external clock is used

- Using external clock

### 4. Treatment of power supply pins ( $V_{CC}/V_{SS}$ )

When the device is provided with multiple  $V_{CC}$  and  $V_{SS}$  pins, be sure to connect all of the power pins to the power supply and ground outside the device to reduce latch-up and unwanted radiation, prevent the strobe signal from malfunctioning due to a rise of ground level, and to follow the standards of total output current for device design reasons. The power supply source should be connected to the  $V_{CC}$  and  $V_{SS}$  of this device at the lowest possible impedance. It is also advisable to connect a bypass capacitor of approximately  $0.1 \mu F$  between  $V_{CC}$  and  $V_{SS}$  near this device.

### 5. About crystal oscillator circuit

Noise near the X0/X1 pin may cause the device to malfunction. When designing the artwork for a PC board using the microcontroller, it is strongly advisable to place the X0/X1 and crystal (ceramic) oscillator, and the bypass capacitor leading to the ground as close to one another as possible and prevent their wiring patterns from crossing other patterns as possible because stable operation can be expected with such a layout.

### 6. Caution on Operations during PLL Clock Mode

Even if the oscillator comes off or the clock input stops with the PLL clock selected for this microcontroller, the microcontroller may continue to operate at the free-running frequency of the PLL internal automatic oscillator circuit. Performance of this operation, however, cannot be guaranteed.

## 7. Stabilization of supply voltage

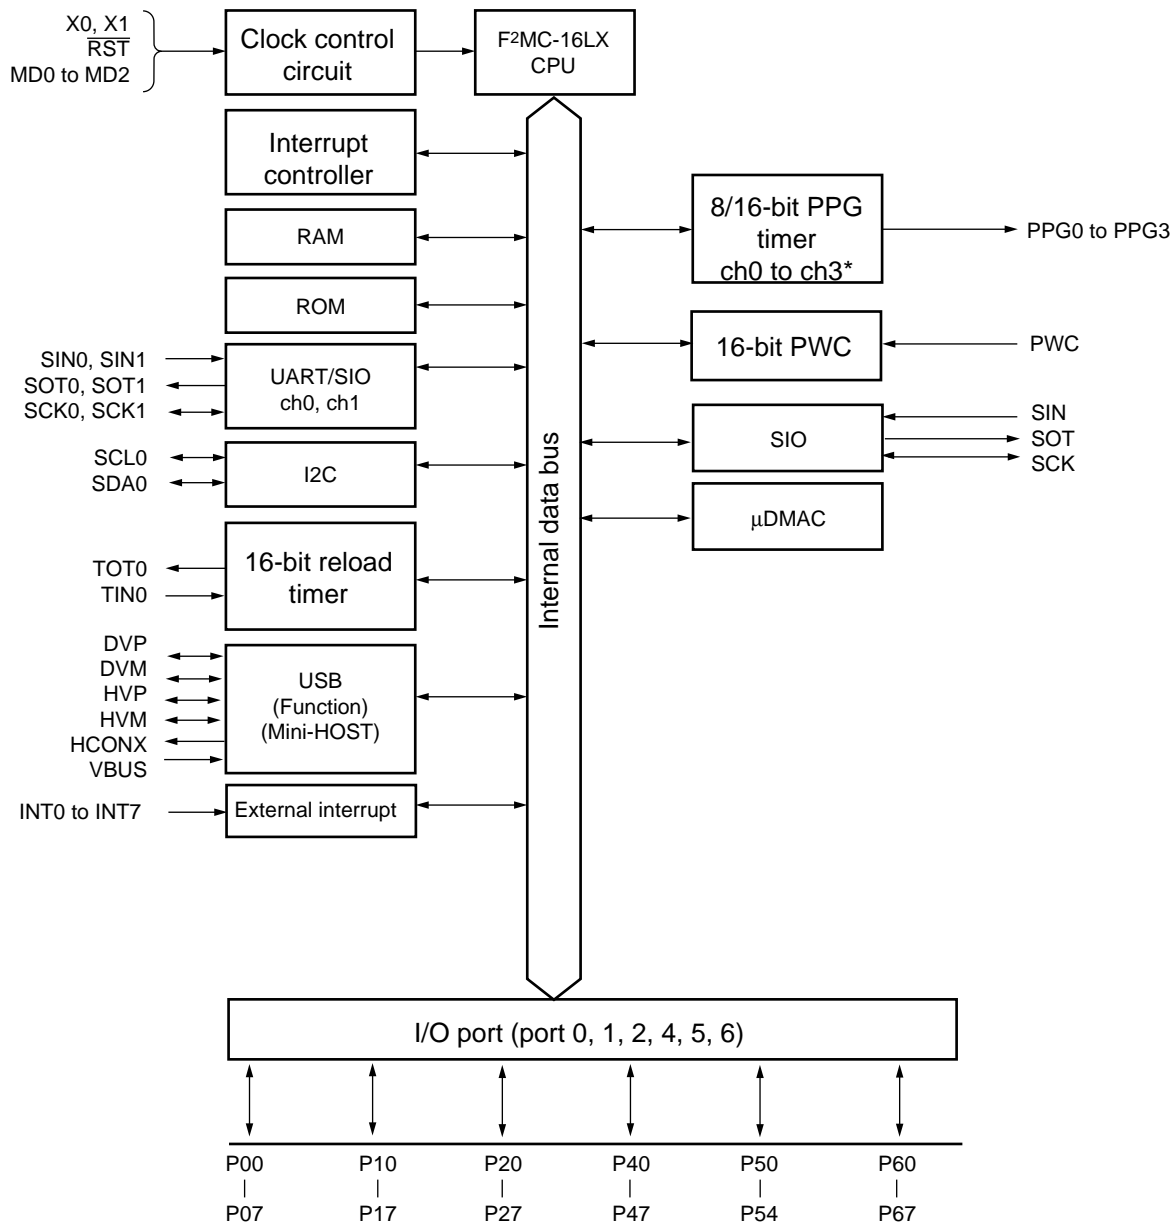

A sudden change in the supply voltage may cause the device to malfunction even within the  $V_{CC}$  supply voltage operating range. For stabilization reference, the supply voltage should be controlled so that  $V_{CC}$  ripple variations (peak-to-peak values) at commercial frequencies (50 MHz to 60 MHz) fall below 10% of the standard  $V_{CC}$  supply voltage and the transient regulation does not exceed 0.1 V/ms at temporary changes such as power supply switching.

## 8. Writing to flash memory

For serial writing to flash memory, always make sure that the operating voltage  $V_{CC}$  is between 3.13 V and 3.6 V.

For normal writing to flash memory, always make sure that the operating voltage  $V_{CC}$  is between 3.0 V and 3.6 V.

## ■ BLOCK DIAGRAM

\* : Channel for use in 8-bit mode. Two channels (ch1, ch3) are used in 16-bit mode.

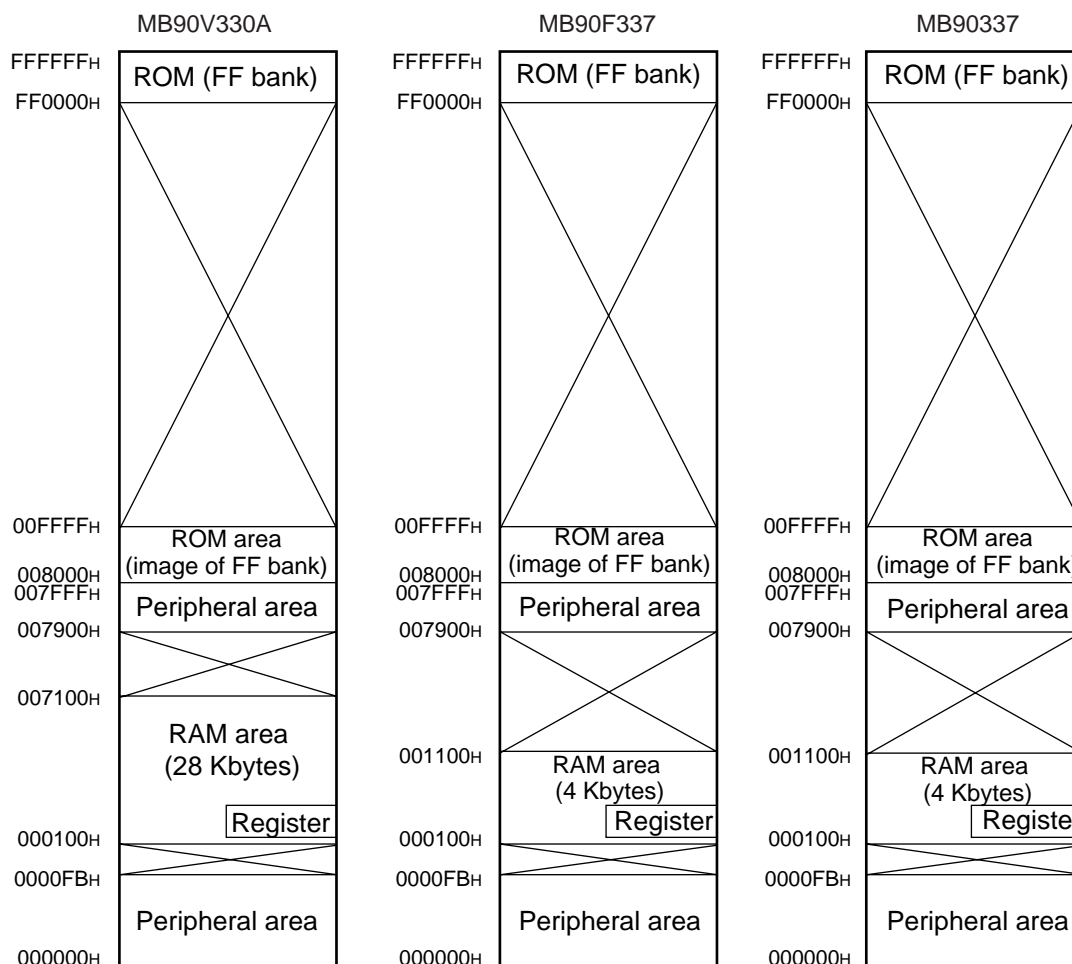

Note : I/O ports share pins with peripheral resources.

For details, see "■ PIN ASSIGNMENT" and "■ PIN DESCRIPTION".

Note also that pins used for peripheral resources cannot serve as I/O ports.

## ■ MEMORY MAP

Single chip mode (ROM mirror function)

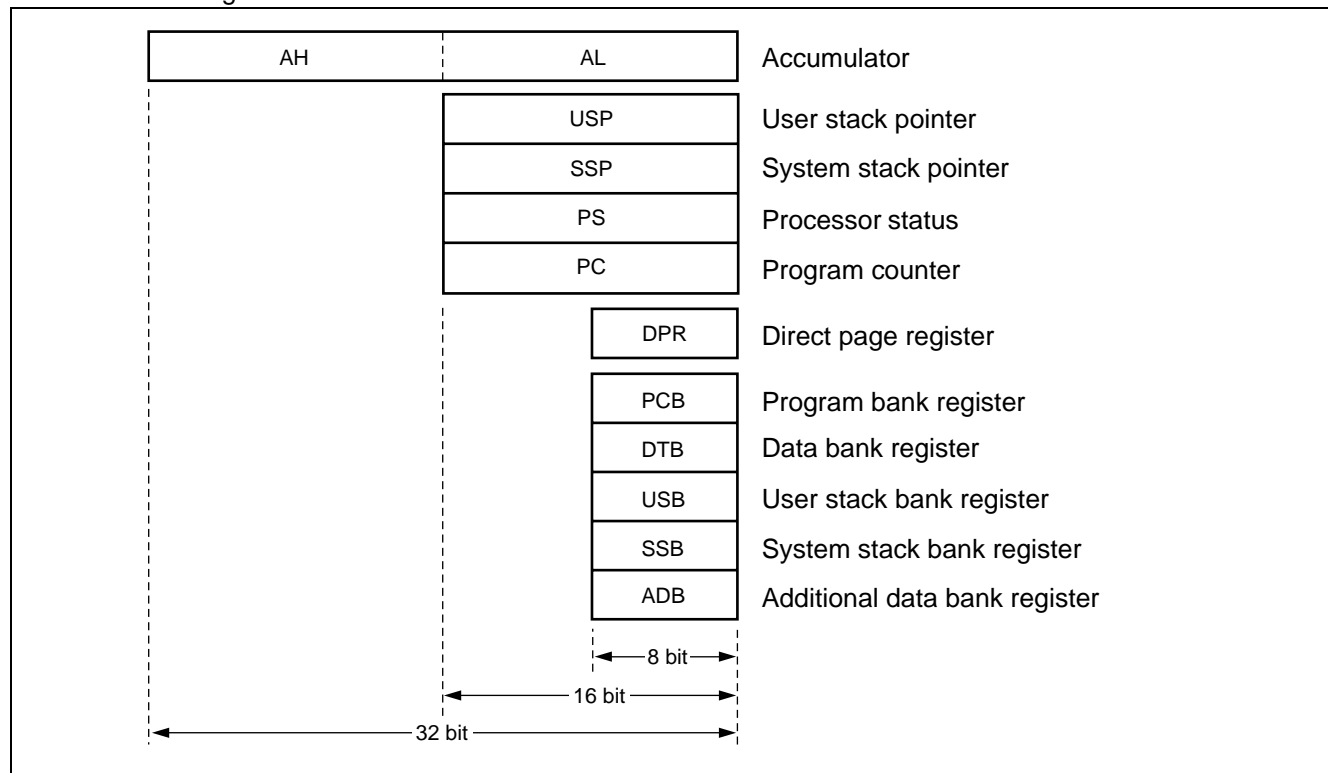

Memory Map of MB90335 Series

- Notes :
- When the ROM mirror function register has been set, the mirror image data at higher addresses ("FF8000H to FFFFFH") of bank FF is visible from the higher addresses ("008000H to 00FFFFH") of bank 00.
  - For setting the ROM mirror function, see "16. ROM mirror function select module" in "■ PERIPHERAL RESOURCES".

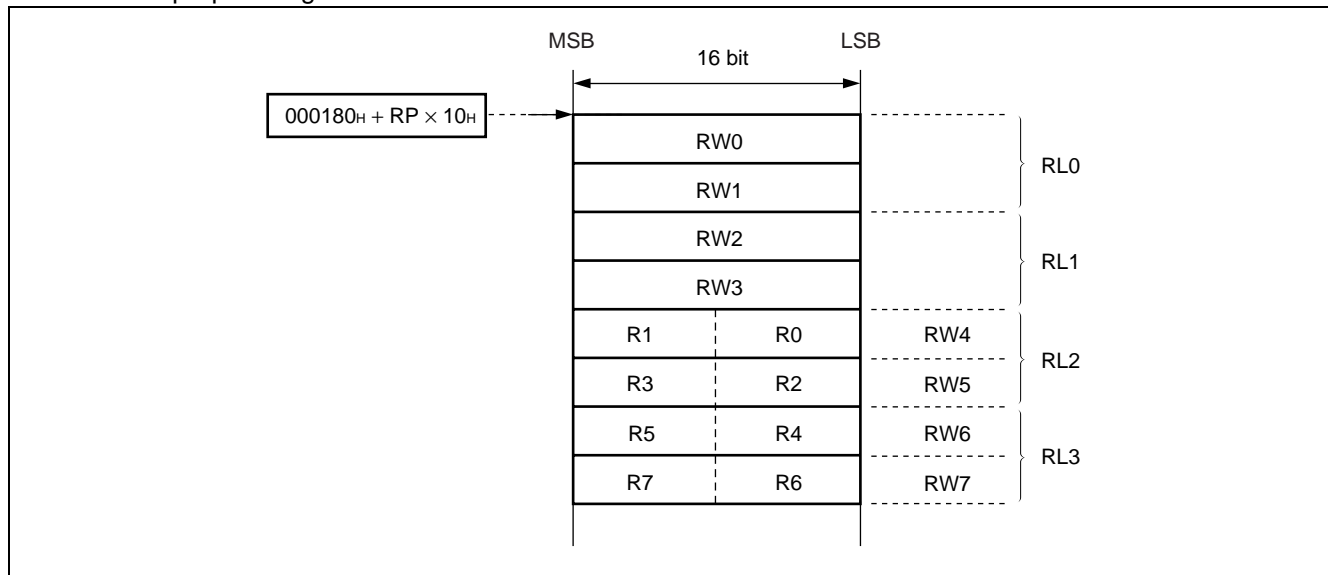

- Reference :
- The ROM mirror function is for using the C compiler small model.
  - The lower 16-bit addresses of bank FF are equivalent to those of bank 00. Since the ROM area in bank FF exceeds 48 Kbytes, however, the mirror image of all the data in the ROM area cannot be reproduced in bank 00.
  - When the C compiler small model is used, the data table mirror image can be shown at "008000H to 00FFFFH" by storing the data table at "FF8000H to FFFFFH". Therefore, data tables in the ROM area can be referenced without declaring the far addressing with the pointer.

## ■ F<sup>2</sup>MC-16L CPU PROGRAMMING MODEL

- Dedicated register

- General purpose registers

- Processor status

- Explanation on read/write

R/W Read and write enabled

R Read only

W Write only

- Explanation of initial values

0 : Initial Value is "0".

1 : Initial Value is "1".

X : Initial Value is undefined.

- : Initial Value is undefined (None).

Note : No IO instruction can be used for registers located between 007900<sub>H</sub> to 007FFF<sub>H</sub>.

- ◎ : Available. EI<sup>2</sup>OS stop function provided (The interrupt request flag is cleared by the interrupt clear signal. There is a stop demand.)
- : Available (The interrupt request flag is cleared by the interrupt clear signal).
- △ : Available when any interrupt source sharing ICR is not used.
- × : Unavailable
- If the same interrupt control register (ICR) has two interrupt factors and the use of the EI<sup>2</sup>OS is permitted, the EI<sup>2</sup>OS is activated when either of the factors is detected. As any interrupt other than the activation factor is masked while the EI<sup>2</sup>OS is running, it is recommended that you should mask either of the interrupt requests when using the EI<sup>2</sup>OS.
- The interrupt flag is cleared by the EI<sup>2</sup>OS interrupt clear signal for the resource that has two interrupt factors in the same interrupt control register (ICR).

Note : If a resource has two interrupt sources for the same interrupt number, both of the interrupt request flags are cleared by the  $\mu$ DMAC interrupt clear signal. Therefore, when you use either of two interrupt factors for the DMAC function, another interrupt function is disabled. Set the interrupt request permission bit to "0" in the appropriate resource, and take measures by software polling.

## ■ USB INTERRUPT FACTOR CONTENTS

USB interrupt factor	Details
USB function 1	End Point0-IN, EndPoint 0-OUT
USB function 2	End Point 1-5
USB function 3	VOFF, VON, SUSP, SOF, BRST, WKOP, COHF
USB function 4	SPIT
USB Mini-HOST1	DIRQ, CHHIRQ, URIRQ, RWKIRQ
USB Mini-HOST2	SOFIRQ, CMPIRQ

## ■ PERIPHERAL RESOURCES

### 1. I/O port

- The I/O ports are used as general-purpose input/output ports (parallel I/O ports). MB90335 series model is provided with 6 ports (45 inputs) . The ports function as input/output pins for peripheral functions also.
- An I/O port, using port data register (PDR) , outputs the output data to I/O pin and input a signal input to I/O port. The port direction register (DDR) specifies direction of input/output of I/O pins on a bit-by-bit basis.
- The following table lists the I/O ports and the peripheral functions with which they share pins.

	Port pin name	Pin Name (Peripheral)	Peripheral Function that Shares Pin
Port 0	P00 to P07	—	
Port 1	P10 to P17	—	
Port 2	P20 to P23	—	
	P24 to P27	PPG0 to PPG3	8/16 bit PPG timer 0, 1
Port 4	P40, P41	TIN0, TOT0	16-bit reload timer
	P42 to P47	SIN0, SOT0, SCK0, SIN1, SOT1, SCK1	UART0, 1
Port 5	P50 to P54	—	
Port 6	P60, P61	INT0, INT1	External interrupt
	P62 to P64	INT2 to INT4, SIN, SOT, SCK	External interrupt, serial IO
	P65	INT5, PWC	External interrupt, PWC
	P66, P67	INT6, INT7, SCL0, SDA0	External interrupt, I <sup>2</sup> C

\* : R/W access to I/O ports is a bit different in behavior from R/W access to memory as follows:

• Input mode

Read : The level at the relevant pin is read.

Write : Data is written to the output latch.

• Output mode

Read : The data register latch value is read.

Write : Data is output to the relevant pin.

## • Register list (port direction register)

DDR0	7	6	5	4	3	2	1	0	Initial Value	Access

DDR6	7	6	5	4	3	2	1	0		
Address : 000016 <sub>H</sub>	D67	D66	D65	D64	D63	D62	D61	D60	00000000 <sub>B</sub>	R/W

- When each pin is serving as a port, the corresponding pin is controlled as follows:

0 : Input mode

1 : Output mode

This bit becomes 0 after a reset.

Note : If these registers are accessed by a read modify write instruction (such as a bit set instruction) , the bits manipulated by the instruction are set to prescribed values but those other bits in output registers which have been set for input are rewritten to the current input values of the pins. When switching a pin from input port to output port, therefore, write a desired value in the PDR first, then set the DDR to switch the pin for output.

## • Register list (Port pull-up register)

RDR0	7	6	5	4	3	2	1	0	Initial Value	Access
Address : 00001C <sub>H</sub>	RD07	RD06	RD05	RD04	RD03	RD02	RD01	RD00	00000000 <sub>B</sub>	R/W
RDR1	15	14	13	12	11	10	9	8		
Address : 00001D <sub>H</sub>	RD17	RD16	RD15	RD14	RD13	RD12	RD11	RD10	00000000 <sub>B</sub>	R/W

Controls the pull-up resistor in input mode.

0 : Without pull-up resistor in input mode.

1 : With Pull-up resistor in input mode.

Meaningless in output mode (without pull-up resistor) ./ The input/output register is decided by the setting of the direction register (DDR) .

No pull-up resistor is used in stop mode (SPL = 1).

- Register list (output pin register)

ODR4	7	6	5	4	3	2	1	0	Initial Value	Access
Address : 00001B <sub>H</sub>	OD47	OD46	OD45	OD44	OD43	OD42	OD41	OD40	00000000 <sub>B</sub>	R/W

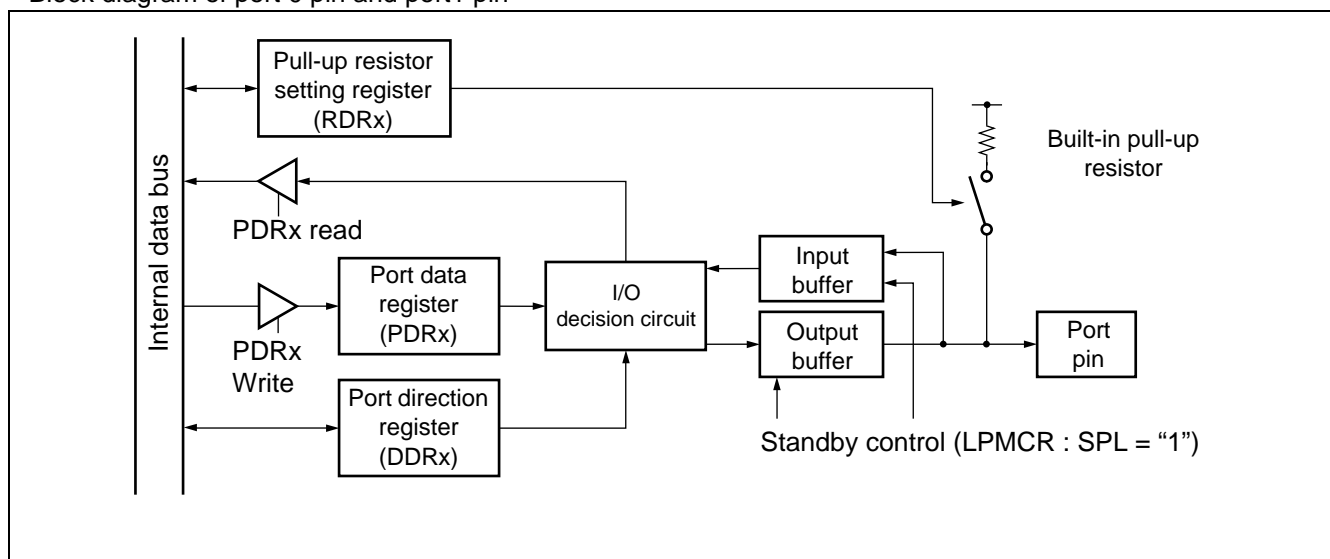

Controls open-drain output in output mode.

0 : Serves as a standard output port in output mode.

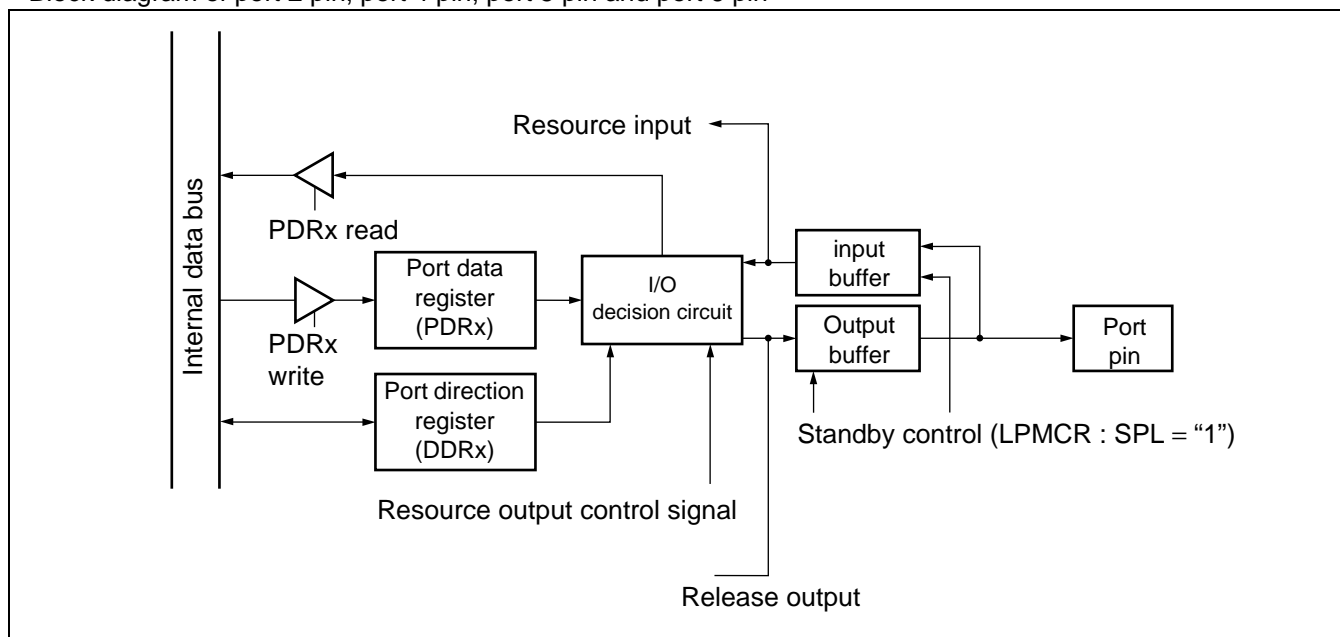

1 : Serves as an open-drain output port in output mode.

Meaningless in input mode. (output High-Z) / The input/output register is decided by the setting of the direction register (DDR) .

- Block diagram of port 0 pin and port1 pin

- Block diagram of port 2 pin, port 4 pin, port 5 pin and port 6 pin

## 2. Time-base timer

- The time-base timer is an 18-bit free-running counter (time-base timer counter) that counts in synchronization with the main clock (2 cycles of the oscillation clock HCLK).
- Four different time intervals can be selected, for each of which an interrupt request can be generated.
- Operating clock signals are supplied to peripheral resources such as the oscillation stabilization wait timer and watchdog timer.

### • Interval time of time-base timer

Internal count clock cycle	Interval time
2/HCLK (0.33 $\mu$ s)	$2^{12}$ /HCLK (Approx. 0.68 ms)
	$2^{14}$ /HCLK (Approx. 2.7 ms)
	$2^{16}$ /HCLK (Approx. 10.9 ms)
	$2^{19}$ /HCLK (Approx. 87.4 ms)

- Notes :
- HCLK : Oscillation clock frequency
  - The parenthesized values assume an oscillator clock frequency of 6 MHz.

### • Clock cycles supplied from time-base timer

Where to supply clock	Clock cycle
Oscillation stabilization wait of main clock	$2^{13}$ /HCLK (Approx. 1.36 ms)
	$2^{15}$ /HCLK (Approx. 5.46 ms)
	$2^{17}$ /HCLK (Approx. 21.84 ms)
Watch dog timer	$2^{12}$ /HCLK (Approx. 0.68 ms)
	$2^{14}$ /HCLK (Approx. 2.7 ms)
	$2^{16}$ /HCLK (Approx. 10.9 ms)
	$2^{19}$ /HCLK (Approx. 87.4 ms)

- Notes :
- HCLK : Oscillation clock frequency
  - The parenthesized values assume an oscillator clock frequency of 6 MHz.

### • Register list

Time-base timer control register (TBTC)								Initial Value 1--00100 <sub>B</sub>
Address: 0000A9 <sub>H</sub>	15	14	13	12	11	10	9	8
	RESV	—	—	TBIE	TBOF	TBR	TBC1	TBC0
	(R/W)	(—)	(—)	(R/W)	(R/W)	(W)	(R/W)	(R/W)

Note : For the conditions for clearing the time-base timer, refer to the chapter for the time-base timer in the hardware manual.

## • Block Diagram

Actual interrupt request number of time-base timer is as follows:

Interrupt request number:#40 (28H)

### 3. Watchdog timer

- The watchdog timer is a timer counter prepared in case programs run out of control.
- The watchdog timer is a 2-bit counter using the time-base timer as the count clock.
- When started, the watchdog timer resets the CPU if it is not cleared before the two-bit counter overflows.

#### • Interval time of watchdog timer

HCLK: Oscillation clock (6 MHz)		
Min	Max	Clock cycle
Approx. 2.39 ms	Approx. 3.07 ms	$2^{14} \pm 2^{11} / \text{HCLK}$
Approx. 9.56 ms	Approx. 12.29 ms	$2^{16} \pm 2^{13} / \text{HCLK}$
Approx. 38.23 ms	Approx. 49.15 ms	$2^{18} \pm 2^{15} / \text{HCLK}$
Approx. 305.83 ms	Approx. 393.22 ms	$2^{21} \pm 2^{18} / \text{HCLK}$

Notes :

- The maximum and minimum time intervals for the watchdog timer depend on the counter clear timing.
- The watchdog timer contains a 2-bit counter that counts the carry signals of the time-base timer. When the device is operating with HCLK, therefore, clearing the time-base timer lengthens the watchdog reset generation time interval.

#### • Event that stop the watchdog timer

- 1 : Stop due to a Power-on reset
- 2 : watchdog reset

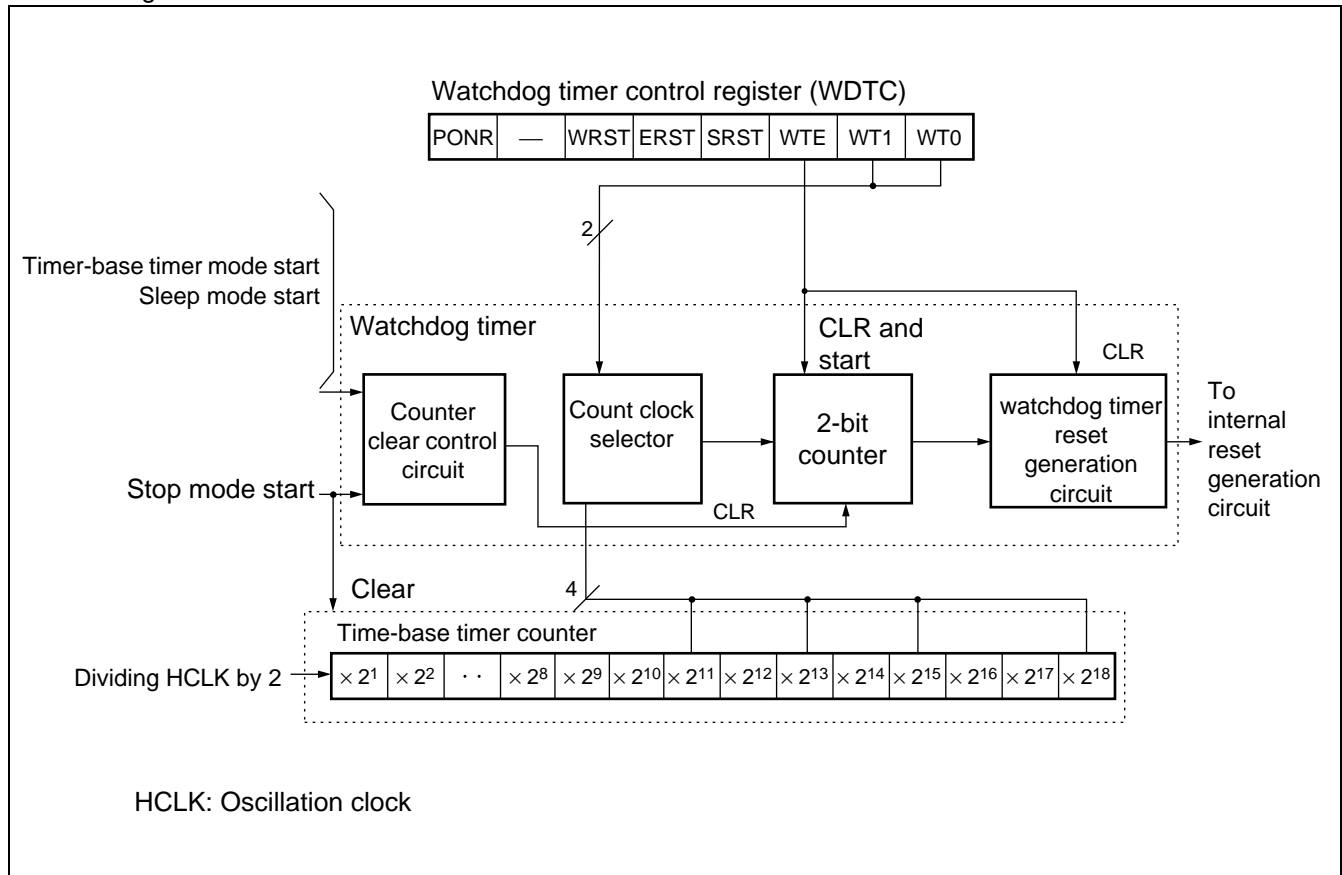

#### • Clear factor of watch dog timer

- 1 : External reset input by RST pin
- 2 : Writing "0" to the software reset bit
- 3 : Writing "0" to the watchdog control bit (second and subsequent times)
- 4 : Transition to sleep mode (Clearing the watchdog timer, and suspend counting)
- 5 : Transition to time-base timer mode (Clearing the watchdog timer, and suspend counting)
- 6 : Transition to stop mode (Clearing the watchdog timer, and suspend counting)

## 4. 16 - bit Reload Timer

The 16-bit reload timer has the internal clock mode to be decrement in synchronization with three different internal clocks and the event count mode to decrement upon detection of an arbitrary edge of the pulse input to the external pin. Either can be selected. This timer defines when the count value changes from 0000<sub>H</sub> to FFFF<sub>H</sub> as an underflow. The timer therefore causes an underflow when the count reaches [reload register setting +1]. Either mode can be selected for the count operation from the reload mode which repeats the count by reloading the count setting value at the underflow occurrence or the one-shot mode which stops the count at the underflow occurrence. The interrupt can be generated at the counter underflow occurrence so as to correspond to the DTC.

## 5. Multifunction timer

- The multifunction timer can be used for waveform output, input pulse width measurement, and external clock cycle measurement.

### • Configuration of a multi-functional timer

8/16 bit PPG timer	16 bit PWC timer
8 bit × 4 ch (16 bit × 2 ch)	1 ch

### • 8/16 bit PPG timer (8 bit : 4 channels, 16 bit : 2 channels)

8/16 bit PPG timer consists of a 8 bit down counter (PCNT) , PPG control register (PPGC0 to PPGC3) , PPG clock control register (PCS01, PCS23) and PPG reload register (PRL0 to PRL3, PRLH0 to PRLH3) .

When used as an 8/16 bit reload timer, the PPG timer serves as an event timer. It can also output pulses of an arbitrary duty ratio at an arbitrary frequency.

#### • 8 bit PPG mode

Each channel operates as an independent 8 bit PPG.

#### • 8 bit prescaler + 8 bit PPG mode

Operates as an arbitrary-cycle 8 bit PPG with ch0 (ch2) operating as an 8 bit prescaler and ch2 (ch3) counted by the borrow output of ch0 (ch2).

#### • 16 bit PPG mode

Operates as a 16 bit PPG with ch0 (ch2) and ch1 (ch3) connected.

#### • PPG Operation

The PPG timer outputs pulses of an arbitrary duty ratio (the ratio between the High and Low level periods of pulse waveform) at an arbitrary frequency. Can also be used as a D/A converter by an external circuit.

The diagram illustrates the internal architecture of the PPG0/2 peripheral module. Key components and their connections include:

- Input Clocks:** Peripheral clock  $\times 16$ ,  $\times 8$ ,  $\times 4$ ,  $\times 2$ , and the Peripheral clock are provided to the module.
- Count Clock Selector:** Selects between the input clocks and feeds into the L/H selector.
- Timebase Counter:** Provides a main clock  $\times 512$  to the L/H selector.
- L/H Selector:** Receives inputs from the Count clock selector and Timebase counter, and outputs to the PCNT and PPGC0.
- PCNT (down counter):** Receives the selected clock and outputs to the PPG 0/2 output latch.
- PPG 0/2 output enable:** Controls the output of the PPG 0/2 output latch.
- PPG 0/2 output latch:** Latches the output of the PCNT and outputs to the PPG0/2 and A/D converter.
- PPG0/2 and A/D converter:** Receives the output from the latch.
- PCNT (down counter):** Also outputs to the PUF0 flip-flop.
- PUF0:** A flip-flop that outputs to the PPGC0 and the ch1/3/5 borrow input.
- PIE0:** An input to the PPGC0.
- PPGC0 (operation mode control):** Receives inputs from PUF0, PIE0, and the L data bus, and outputs to the L data bus.
- Interrupts:** The output of the PPGC0 is connected to an AND gate, which generates interrupts #30 ( $1E_H$ )\* and #32 ( $20_H$ )\*.
- Data Buses:** The module is connected to the L data bus and H data bus.

## 6. UART

### Overview of UART

- UART is a general purpose serial communication interface for synchronous or asynchronous (start-stop synchronization) communications with external devices.
- It supports bi-directional communication (normal mode) and master/slave communication (multi-processor mode: supported on master side only).
- An interrupt can be generated upon completion of reception, detection of a reception error, or upon completion of transmission. EI<sup>2</sup>OS is supported also.

### • UART functions

UART, or a generic serial data communication interface that sends and receives serial data to and from other CPU and peripherals, has the functions listed in following.

	Function
Data buffer	Full-duplex double-buffered
Transmission mode	<ul style="list-style-type: none"> <li>• Clock synchronous (without start/stop bit)</li> <li>• Clock asynchronous (start-stop synchronous)</li> </ul>
Baud rate	<ul style="list-style-type: none"> <li>• Special-purpose baud-rate generator It is optional from eight kinds.</li> <li>• Baud rate by external clock (clock of SCK0/SCK1 terminal input)</li> </ul>
Data length	<ul style="list-style-type: none"> <li>• 8 bits or 7 bits (in the asynchronous normal mode only)</li> <li>• 1 to 8 bits (in the synchronous mode only)</li> </ul>
Signaling system	Non Return to Zero (NRZ) system
Reception error detection	<ul style="list-style-type: none"> <li>• Framing error</li> <li>• Overrun error</li> <li>• Parity error (Not supported in operation mode 1)</li> </ul>
Interrupt request	<ul style="list-style-type: none"> <li>• Receive interrupt (reception completed, reception error detected)</li> <li>• Transmission interrupt (transmission completed)</li> <li>• Both the transmission and reception support EI<sup>2</sup>OS.</li> </ul>
Master/slave type communication function (multi processor mode)	Capable of 1 (master) to n (slaves) communication (available just as master)

Note : In clock synchronous transfer mode, the UART transfers only data with no start or stop bit added.

### UART operation modes

Operation mode		Data length		Synchronization	Stop bit length
		Without parity	With parity		
0	Normal mode	7 bits or 8 bits		Asynchronous	1 bit or 2 bits *2
1	Multi processor mode	8 + 1 *1	—	Asynchronous	
2	Normal mode	8	—	Synchronous	No

— : Setting disabled

\*1 : + 1 is an address/data setting bit (A/D) which is used for communication control.

\*2 : Only one bit can be detected as a stop bit at reception.

## 7. Extended I/O serial interface

The extended I/O serial interface is a serial I/O interface that can transfer data through the adoption of 8-bit × 1 channel configured clock synchronization scheme. LSB-first or MSB-first transfer mode can be selected for data transfer.

There are two serial I/O operation modes available:

- Internal shift clock mode: Transfer data in synchronization with the internal clock.
- External shift clock mode: Transfer data in synchronization with the clock supplied via the external pin (SCK). By manipulating the general-purpose port sharing the external pin (SCK) in this mode, data can also be transferred by a CPU instruction.

## 8. I<sup>2</sup>C Interface

The I<sup>2</sup>C interface is a serial I/O port supporting the Inter IC BUS. It serves as a master/slave device on the I<sup>2</sup>C bus and has the following features.

- Master/slave sending and receiving
- Arbitration function
- Clock synchronization function
- Slave address and general call address detection function
- Detecting transmitting direction function
- Start condition repeated generation and detection function
- Bus error detection function

## 9. USB Function

The USB is an interface supporting the USB (Universal Serial Bus) communications protocol.

Feature of USB function

- Conform to USB 2.0 Full Speed
- FULL speed (12 Mbps) is supported.
- The device status is auto-answer.
- Bit stripping, bit stuffing, and automatic generation and check of CRC5 and CRC16.
- Toggle check by data synchronization bit.
- Automatic response to all standard commands except Get/SetDescriptor and SynchFrame commands (these three commands can be processed the same way as the class vendor commands).
- The class vendor commands can be received as data and responded via firmware.
- Supports up to maximum six EndPoints (EndPoint0 is fixed to control transfer).
- Two transfer data buffers integrated for each end point (one IN buffer and one OUT buffer for end point 0).
- Supports automatic transfer mode for transfer data via DMA (except buffers for EndPoint0).
- Capable of detection of connection and disconnection by monitoring the USB bus power line.

## 10. USB Mini-HOST

USB Mini-HOST provides minimal host operations required and is a function that enables data to be transferred to and from Device without PC intervention.

### Feature of USB Mini-HOST

- Automatic detection of Low Speed/Full Speed transfer
- Low Speed/Full Speed transfer support
- Automatic detection of connection and cutting device
- Reset sending function support to USB-bus
- Support of IN/OUT/SETUP/SOF token
- In-token handshake packet automatic transmission (excluding STALL)
- Handshake packet automatic detection at out-token
- Supports a maximum packet length of 256 bytes
- Error (CRC error/toggle error/time-out) various supports
- Wake-Up function support

### Differences between the USB HOST and USB Mini-HOST

		HOST	Mini-HOST
Hub support		○	×
Transfer	Bulk transfer	○	○
	Control transfer	○	○
	Interrupt transfer	○	○
	ISO transfer	○	×
Transfer speed	Low Speed	○	○
	Full Speed	○	○
PRE packet support		○	×
SOF packet support		○	○
Error	CRC error	○	○
	Toggle error	○	○
	Time-out	○	○
	Maximum packet < receive data	○	○
Detection of connection and cutting of device		○	○
Transfer speed detection		○	○

- : Supported  
× : Not supported

## 11. DTP/external interrupt circuit

### Feature of DTP/external interrupt circuit

DTP (Data Transfer Peripheral)/external interrupt circuit detects the interrupt request input from the external interrupt input terminal INT7 to INT0, and outputs the interrupt request.

- DTP/external interrupt circuit function

The DTP/external interrupt function outputs an interrupt request upon detection of the edge or level signal input to the external interrupt input pins (INT7 to INT0).

If CPU accept the interrupt request, and if the extended intelligent I/O service (EI<sup>2</sup>OS) is enabled, branches to the interrupt handling routine after completing the automatic data transfer (DTP function) performed by EI<sup>2</sup>OS. And if EI<sup>2</sup>OS is disabled, it branches to the interrupt handling routine without activating the automatic data transfer (DTP function) performed by EI<sup>2</sup>OS.

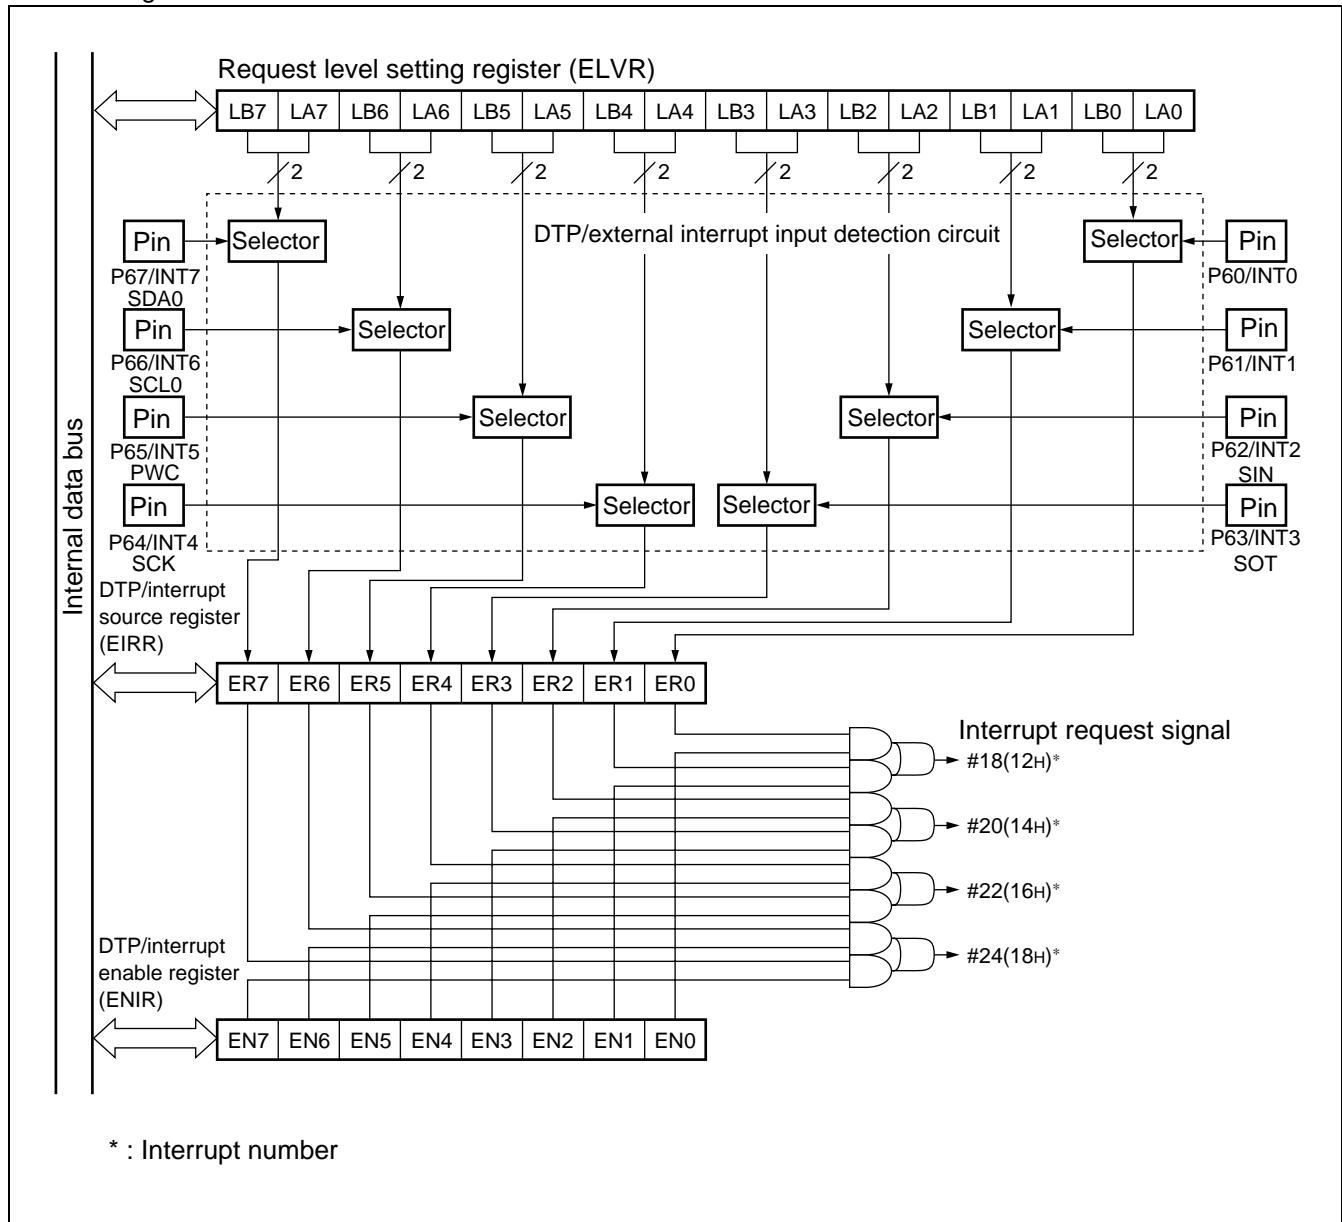

- Feature of DTP/external interrupt circuit

	External interrupt	DTP function
Input pin	8 channels (P60/INT0, P61/INT1, P62/INT2/SIN, P63/INT3/SOT, P64/INT4/SCK, P65/INT5/PWC, P66/INT6/SCL0, P67/INT7/SDA0)	
Interrupt source	The detection level or the type of the edge for each terminals can be set in the request level setting register (ELVR)	
	Input of "H" level/ "L" level/rising edge/falling edge.	
Interrupt number	#18 (12 <sub>H</sub> ) , #20 (14 <sub>H</sub> ) , #22 (16 <sub>H</sub> ) , #24 (18 <sub>H</sub> )	
Interrupt control	Enabling/Prohibit the interrupt request output using the DTP/interrupt enable register (ENIR)	
Interrupt flag	Holding the interrupt source using the DTP/interrupt cause register (EIRR)	
Process setting	Prohibit EI <sup>2</sup> OS (ICR: ISE="0")	Enable EI <sup>2</sup> OS (ICR: ISE="1")
Process	Branched to the interrupt handling routine	After an automatic data transfer by EI <sup>2</sup> OS, Branched to the interrupt handling routine

## 12. Interrupt controller

The interrupt control register is located inside the interrupt controller, it exists for every I/O having an interrupt function. This register has the following functions.

- Setting of the interrupt levels of relevant peripheral

Note : Do not access interrupt control registers using any read modify write instruction because it causes a malfunction.

### • Block Diagram

## 13. $\mu$ DMA

$\mu$ DMA is simple DMA with the function equal with EI<sup>2</sup>OS. It has 16 channels DMA transfer channels with the following features.

- Performs automatic data transfer between the peripheral resource (I/O) and memory
- The program execution of CPU stops in the DMA startup
- Capable of selecting whether to increment the transfer source and destination addresses
- DMA transfer is controlled by the DMA enable register, DMA stop status register, DMA status register and descriptor
- A STOP request is available for stopping DMA transfer from the resource
- Upon completion of DMA transfer, the flag bit corresponding to the transfer completed channel in the DMA status register is set and a termination interrupt is output to the transfer controller.

### • Register list

#### DMA enable register higher (DERH)

Address : 0000AD <sub>H</sub>	15	14	13	12	11	10	9	8	Initial Value

## 14. Address matching detection function

When the address is equal to the value set in the address detection register, the instruction code to be read into the CPU is forcibly replaced with the INT9 instruction code (01H). As a result, the CPU executes the INT9 instruction when executing the set instruction. By performing processing by the INT#9 interrupt routine, the program patch function is enabled.

Two address detection registers are provided, for each of which there is an interrupt enable bit. When the address matches the value set in the address detection register with the interrupt enable bit set to 1, the instruction code to be read into the CPU is forcibly replaced with the INT9 instruction code.

EI <sup>2</sup> OS support	• Not ready for extended intelligent I/O service (EI <sup>2</sup> OS).

### • Block Diagram

## 17. Low power consumption (standby) mode

- The F<sup>2</sup>MC-16LX can be set to save power consumption by selecting and setting the low power consumption mode.

### • CPU operation mode and functional description

CPU operating clock	Operation mode	Description
PLL clock	Normally run	The CPU and peripheral resources operate at the clock frequency obtained by PLL multiplication of the oscillator clock (HCLK) frequency.
	Sleep	Only peripheral resources operate at the clock frequency obtained by PLL multiplication of the oscillator clock (HCLK) frequency.
	Time-base timer	Only the time-base timer operates at the clock frequency obtained by PLL multiplication of the oscillator clock (HCLK) frequency.
	Stop	The CPU and peripheral resources are suspended with the oscillator clock stopped.
Main clock	normally run	The CPU and peripheral resources operate at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Sleep	Only peripheral resources operate at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Time-base timer	Only the time-base timer operates at the clock frequency obtained by dividing the oscillator clock (HCLK) frequency by two.
	Stop	The CPU and peripheral resources are suspended with the oscillator clock stopped.
CPU intermittent operation mode	Normally run	The halved or PLL-multiplied oscillator clock (HCLK) frequency is used for operation while being decimated in a certain period.

## 19. 512 Kbits flash memory

The description that follows applies to the flash memory built in the MB90F334; it is not applicable to evaluation ROM or masked ROM.

The method of data write/erase to flash memory is following three types.

- Parallel writer
- Serial dedicated writer
- Write/erase by executing program

- Description of 512 Kbits flash memory

512 Kbits flash memory is located in FF<sub>H</sub> bank in the CPU memory map. Function of flash memory interface circuit enables read and program access from CPU.

Write/erase to flash interface is executed by instruction from CPU via flash memory interface, so rewrite of program and data is carried on in the mounting state effectively.

Data can be reprogrammed not only by program execution in existing RAM but by program execution in flash memory by dual operation. The different banks (the upper and lower banks) can be used to execute an erase/program and a read concurrently.

Also, erase/write and read in the different bank (Upper Bank/Lower Bank) is executed simultaneously.

- Features of 512 Kbits flash memory

- Sector configuration : 64 Kwords × 8 bits/32 words × 16 bits (4K × 4 + 16K × 2 + 4K × 4)
- Simultaneous execution of erase/write and read by 2-bank configuration
- Automatic program algorithm (Embedded Algorithm™\*)
- Built-in deletion pause/deletion resume function
- Detection of programming/erasure completion using data polling and the toggle bit
- At least 10,000 times guaranteed
- Minimum flash read cycle time : 2 machine cycles

\* : Embedded Algorithm™ is a trade mark of Advanced Micro Devices Inc.

Note : The read function of manufacture code and device code is not including.

Also, these code is not accessed by the command.

- Flash write/erase
- Flash memory can not execute write/erase and read by the same bank simultaneously.
- Data can be programmed/deleted into and erased from flash memory by executing either the program residing in the flash memory or the one copied to RAM from the flash memory.

- Sector configuration of flash memory

Flash Memory	CPU address	Writer address *	
SA0 (4 Kbyte)	FF0000H	70000H	Lower Bank
	FF0FFFH	70FFFH	
SA1 (4 Kbyte)	FF1000H	71000H	
	FF1FFFH	71FFFH	
SA2 (4 Kbyte)	FF2000H	72000H	
	FF2FFFH	72FFFH	
SA3 (4 Kbyte)	FF3000H	73000H	
	FF3FFFH	73FFFH	
SA4 (16 Kbyte)	FF4000H	74000H	Upper Bank
	FF7FFFH	77FFFH	
SA5 (16 Kbyte)	FF8000H	78000H	
	FFBFFFH	78FFFH	
SA6 (4 Kbyte)	FFC000H	7C000H	
	FFCFFFH	7CFFFH	
SA7 (4 Kbyte)	FFD000H	7D000H	
	FFDFFFH	7DFFFH	
SA8 (4 Kbyte)	FFE000H	7E000H	
	FFEFFFH	7EFFFH	
SA9 (4Kbyte)	FFF000H	7F000H	
	FFFFFFH	7FFFFH	

\* : Flash memory writer address indicates the address equivalent to the CPU address when data is written to the flash memory using a parallel writer. Programming and erasing by the general-purpose parallel programmer are executed based on writer addresses.

- Standard configuration for Fujitsu standard serial on-board writing

The flash microcontroller programmer (AF220/AF210/AF120/AF110) made by Yokogawa Digital Computer Corp. is used for Fujitsu standard serial onboard writing.

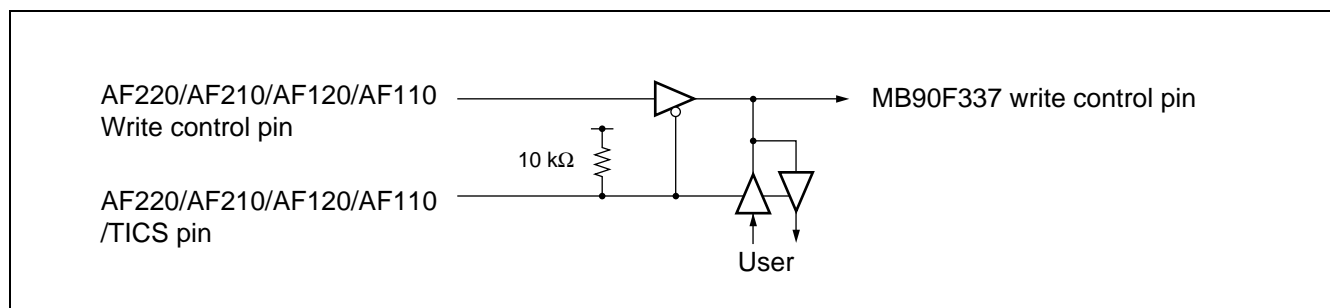

Note : Inquire of Yokogawa Digital Computer Corporation for details about the functions and operations of the flash microcontroller programmer (AF220, AF210, AF120 and AF110) , general-purpose common cable for connection (AZ210) and connectors.

- Pins Used for Fujitsu Standard Serial On-board Programming

Pin	Function	Description
MD2, MD1, MD0	Mode input pin	The device enters the serial program mode by setting MD2 = 1, MD1 = 1 and MD0 = 0.
X0, X1	Oscillation pin	Because the internal CPU operation clock is set to be the 1 multiplication PLL clock in the serial write mode, the internal operation clock frequency is the same as the oscillation clock frequency.
P60, P61	Write program start pins	Input a Low level to P60 and a High level to P61.
$\overline{RST}$	Reset input pin	—
SIN0	Serial data input pin	UART0 is used as CLK synchronous mode. In write mode, the pins used for the UART0 CLK synchronous mode are SIN0, SOT0, and SCK0.
SOT0	Serial data output pin	
SCK0	Serial clock input pin	
V <sub>CC</sub>	Power source input pin	When supplying the write voltage (MB90F337 : 3.3 V $\pm$ 0.3 V) from the user system, connection with the flash microcontroller programmer is not necessary. When connecting, do not short-circuit with the user power supply.
V <sub>SS</sub>	GND Pin	Share GND with the flash microcontroller programmer.

The control circuit shown in the diagram is required for using the P60, P61, SIN0, SOT0 and SCK0 pins on the user system. Isolate the user circuit during serial on-board writing, with the /TICS signal of the flash microcontroller programmer.

Control circuit

The MB90F337 serial clock frequency that can be input is determined by the following expression • Use the flash microcontroller programmer to change the serial clock input frequency setting depending on the oscillator clock frequency to be used.

Imputable serial clock frequency =  $0.125 \times \text{oscillation clock frequency}$ .

- Maximum serial clock frequency

Oscillation clock frequency	Maximum serial clock frequency acceptable to the microcontroller	Maximum serial clock frequency that can be set with the AF220/AF210/AF120/AF110	Maximum serial clock frequency that can be set with the AF200
At 6 MHz	750 kHz	500 kHz	500 kHz

- System configuration of the flash microcontroller programmer (AF220/AF210/AF120/AF110) (made by Yokogawa Digital Computer Corp.)

Part number		Function	
Unit	AF220/AC4P	Model with internal Ethernet interface	/100 V to 220 V power adapter
	AF210/AC4P	Standard model	/100 V to 220 V power adapter

AZ290		Remote controller	
/P2		2 MB PC Card (option) FLASH memory capacity to respond to 128 KB	
/P4		4 MB PC Card (option) FLASH memory capacity to respond to 512 KB	

Contact to : Yokogawa Digital Computer Corp. TEL : (81)-42-333-6224

Note : The AF200 flash micon programmer is a retired product, but it can be supported using control module FF201.

## ■ ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings

( $V_{CC} = 3.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage	$V_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	
Input voltage	$V_I$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*1
		$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	Nch0.D (Withstand voltage I/O of 5 V)
		- 0.5	$V_{SS} + 4.5$	V	USB I/O
Output voltage	$V_O$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*1
		- 0.5	$V_{SS} + 4.5$	V	USB I/O
L level maximum output current	$I_{OL1}$	—	10	mA	Other than USB I/O*2
	$I_{OL2}$	—	43	mA	USB I/O*2
L level average output current	$I_{OLAV}$	—	3	mA	*3
L level maximum total output current	$\Sigma I_{OL}$	—	60	mA	
L level average total output current	$\Sigma I_{OLAV}$	—	30	mA	*4
H level maximum output current	$I_{OH1}$	—	- 10	mA	Other than USB I/O*2
	$I_{OH2}$	—	- 43	mA	USB I/O*2
H level average output current	$I_{OHAV}$	—	- 3	mA	*3
H level maximum total output current	$\Sigma I_{OH}$	—	- 60	mA	
H level average total output current	$\Sigma I_{OHAV}$	—	- 30	mA	*4
Power consumption	$P_d$	—	351	mW	Target value
Operating temperature	$T_A$	- 40	+ 85	°C	
Storage temperature	$T_{stg}$	- 55	+ 150	°C	
		- 55	+ 125	°C	USB I/O

\*1 :  $V_I$  and  $V_O$  must not exceed  $V_{CC} + 0.3\text{ V}$ . However, if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supersedes the  $V_I$  rating.

\*2 : A peak value of an applicable one pin is specified as a maximum output current.

\*3 : The average output current specifies the mean value of the current flowing in the relevant single pin during a period of 100 ms.

\*4 : The average total output current specifies the mean value of the currents flowing in all of the relevant pins during a period of 100 ms.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

## 2. Recommended Operating Conditions

( $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply voltage	$V_{CC}$	3.0	3.6	V	At normal operation (At USB is used)
		2.7	3.6	V	At normal operation (At USB is unused)
		1.8	3.6	V	Hold state of stop operation
Input H level voltage	$V_{IH}$	$0.7 V_{CC}$	$V_{CC} + 0.3$	V	CMOS input pin
	$V_{IHS}$	$0.8 V_{CC}$	$V_{CC} + 0.3$	V	CMOS hysteresis input pin
	$V_{IHM}$	$V_{CC} - 0.3$	$V_{CC} + 0.3$	V	MD input pin
	$V_{IHUSB}$	2.0	$V_{CC} + 0.3$	V	USB input pin
Input L level voltage	$V_{IL}$	$V_{SS} - 0.3$	$0.3 V_{CC}$	V	CMOS input pin
	$V_{ILS}$	$V_{SS} - 0.3$	$0.2 V_{CC}$	V	CMOS hysteresis input pin
	$V_{ILM}$	$V_{SS} - 0.3$	$V_{SS} + 0.3$	V	MD input pin
	$V_{ILUSB}$	$V_{SS}$	0.8	V	USB input pin
Differential input sensitivity	$V_{DI}$	0.2	—	V	USB input pin
Differential common mode input voltage range	$V_{CM}$	0.8	2.5	V	USB input pin
Series resistance	$R_S$	25	30	$\Omega$	Recommended value = $27\ \Omega$ at using USB
Operating temperature	$T_A$	- 40	+ 85	$^{\circ}\text{C}$	At USB is unused
		0	+ 70	$^{\circ}\text{C}$	At USB is used

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

## 3. DC Characteristics

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Sym- bol	Pin name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Output H level voltage	V <sub>OH</sub>	Output pin of other than P60 to P67, HVP, HVM, DVP, DVM	I <sub>OH</sub> = −4.0 mA	V <sub>CC</sub> − 0.5	—	V <sub>CC</sub>	V	
		HVP, HVM, DVP, DVM	RL = 15 kΩ ± 5%	2.8	—	3.6	V	
Output L level voltage	V <sub>OL</sub>	Output pin of other than HVP, HVM, DVP, DVM	I <sub>OL</sub> = 4.0 mA	V <sub>SS</sub>	—	V <sub>SS</sub> + 0.4	V	
		HVP, HVM, DVP, DVM	RL = 1.5 kΩ ± 5%	0	—	0.3	V	
Input leak current	I <sub>IL</sub>	Output pin of other than P60 to P67, HVP, HVM, DVP, DVM	V <sub>CC</sub> = 3.3 V, V <sub>SS</sub> < V <sub>I</sub> < V <sub>CC</sub>	− 10	—	10	μA	
		HVP, HVM, DVP, DVM	—	− 5	—	5	μA	
Pull-up resistor	R <sub>PULL</sub>	P00 to P07, P10 to P17	V <sub>CC</sub> = 3.3 V, Ta = + 25 °C	25	50	100	kΩ	
Open drain output current	I <sub>LIOD</sub>	P60 to P67	—	—	0.1	10	μA	
Power supply current	I <sub>CC</sub>	V <sub>CC</sub>	V <sub>CC</sub> = 3.3 V, Internal frequency 24 MHz, At normal operating	—	TBD	—	mA	At USB operating Max 90 mA (Target)
			V <sub>CC</sub> = 3.3 V, Internal frequency 24 MHz, At normal operating	—	70	—	mA	At non-operating USB (USTP = 0)
			V <sub>CC</sub> = 3.3 V, Internal frequency 24 MHz, At normal operating	—	TBD	—	mA	At non-operating USB (USTP = 1)
	I <sub>CCS</sub>		V <sub>CC</sub> = 3.3 V, Internal frequency 24 MHz, At sleep mode	—	27	—	mA	
	I <sub>CTS</sub>		V <sub>CC</sub> = 3.3 V, Internal frequency 24 MHz, At timer mode	—	3.5	—	mA	
			V <sub>CC</sub> = 3.3 V, Internal frequency 3 MHz, At timer mode	—	1	—	mA	
	I <sub>CCH</sub>		Ta = +25 °C, At Stop mode	—	1	—	μA	
Input capacitance	C <sub>IN</sub>	Other than V <sub>CC</sub> and V <sub>SS</sub>	—	—	5	15	pF	
Pull-up resistor	R <sub>up</sub>	R <sub>ST</sub>	—	25	50	100	kΩ	

Note : P60 to P67 are N-ch open-drain pins usually used as CMOS.

## 4. AC Characteristics

### (1) Clock input timing

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Sym- bol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Clock frequency	$f_{CH}$	X0, X1	—	6	—	MHz	External crystal oscillation
			6	—	24	MHz	External clock input
Clock cycle time	$t_{HCYL}$	X0, X1	—	166.7	—	ns	External crystal oscillation
			166.7	—	41.7	ns	External clock input
Input clock pulse width	$P_{WH}$ $P_{WL}$	X0	10	—	—	ns	A reference duty ratio is 30% to 70%.
Input clock rise time and fall time	$t_{cr}$ $t_{cf}$	X0	—	—	5	ns	At external clock
Internal operating clock frequency	$f_{CP}$	—	3	—	24	MHz	At main clock is used
Internal operating clock cycle time	$t_{CP}$	—	42	—	333	ns	At main clock is used

#### • Clock timing

- PLL operation guarantee range

Relation between internal operation clock frequency and power supply voltage

\* : When the USB is used, operation is guaranteed at voltages between 3.0 V to 3.6 V.

Relation between oscillation frequency and internal operation clock frequency

The AC standards provide that the following measurement reference voltages.

- Input signal waveform

Hysteresis input pin

Hysteresis input/other than MD input pin

- Output signal waveform

Output pin

## (2) Reset

( $V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$ ,  $V_{SS} = 0.0 \text{ V}$ ,  $T_A = -40 \text{ }^{\circ}\text{C}$  to  $+85 \text{ }^{\circ}\text{C}$ )

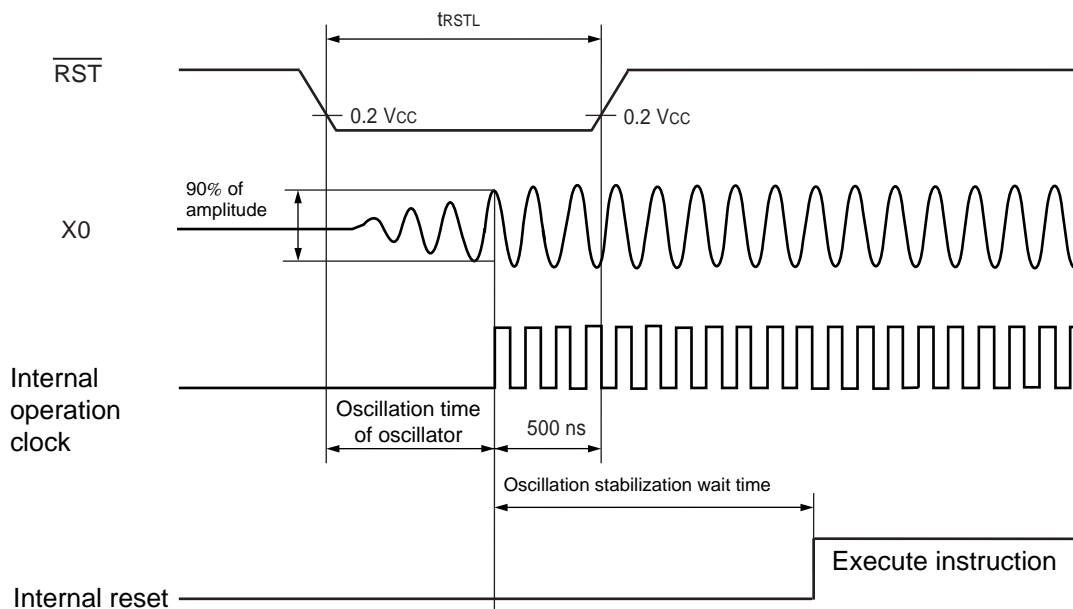

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Reset input time	$t_{RSTL}$	$\overline{RST}$	—	500	—	ns	At normal operating, At time base timer mode, At main sleep mode, At PLL sleep mode
				Oscillation time of oscillator* + 500 ns	—	$\mu\text{s}$	At stop mode

\* : Oscillation time of oscillator is the time that the amplitude reaches 90 %. It takes several milliseconds to several dozens of milliseconds on a crystal oscillator, several hundreds of microseconds to several milliseconds on a FAR/ceramic oscillator, and 0 milliseconds on an external clock.

- During normal operation, in time-base timer mode, in main sleep mode and in PLL sleep mode

- In stop mode

## (3) Power-on reset

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Pin name	Condi- tions	Value		Unit	Remarks
				Min	Max		
Power supply rising time	$t_R$	$V_{CC}$	—	—	30	ms	
Power supply shutdown time	$t_{OFF}$	$V_{CC}$		1	—	ms	For repeated operation

- Notes :
- $V_{CC}$  must be lower than 0.2 V before the power supply is turned on.
  - The above standard is a value for performing a power - on reset.
  - In the device, there are internal registers which is initialized only by a power-on reset. When the initial ization of these items is expected, turn on the power supply according to the standards.

Sudden change of power supply voltage may activate the power-on reset function.

When changing the power supply voltage during operation as illustrated below, voltage fluctuation should be minimized so that the voltage rises as smoothly as possible. When raising the power, do not use PLL clock. However, if voltage drop is 1 V/s or less, use of PLL clock is allowed during operation.

## (4) UART0, UART1 I/O extended serial timing

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

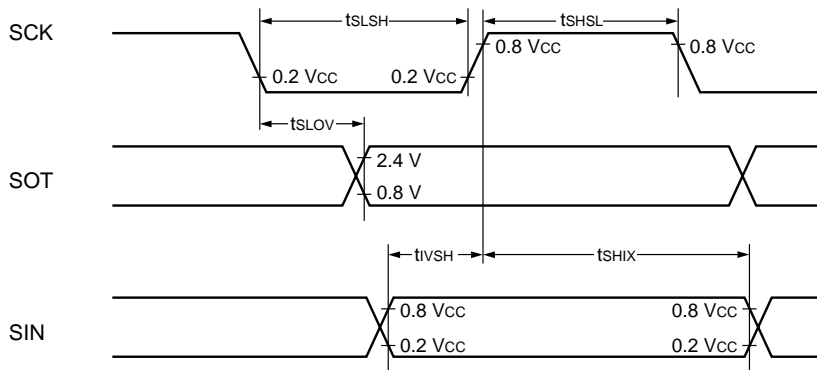

Parameter	Sym- bol	Pin name	Conditions	Value		Unit	Remarks
				Min	Max		
Serial clock cycle time	$t_{SCYC}$	SCKx	Internal shift clock Mode output pin is $C_L = 80\text{ pF} + 1\text{ TTL}$	8 $t_{CP}$	—	ns	
SCK $\downarrow \rightarrow$ SOT delay time	$t_{SLOV}$	SCKx SOTx		- 80	80	ns	
Valid SIN $\rightarrow$ SCK $\uparrow$	$t_{IVSH}$	SCKx SINx		100	—	ns	
SCK $\uparrow \rightarrow$ valid SIN hold time	$t_{SHIX}$	SCKx SINx		60	—	ns	
Serial clock H pulse width	$t_{SHSL}$	SCKx, SINx	External shift clock Mode output pin is $C_L = 80\text{ pF} + 1\text{ TTL}$	4 $t_{CP}$	—	ns	
Serial clock L pulse width	$t_{SLSH}$	SCKx, SINx		4 $t_{CP}$	—	ns	
SCK $\downarrow \rightarrow$ SOT delay time	$t_{SLOV}$	SCKx SOTx		—	150	ns	
Valid SIN $\rightarrow$ SCK $\uparrow$	$t_{IVSH}$	SCKx SINx		60	—	ns	
SCK $\uparrow \rightarrow$ valid SIN hold time	$t_{SHIX}$	SCKx SINx		60	—	ns	

- Notes :
- AC rating in CLK synchronous mode.
  - $C_L$  is a load capacitance value on pins for testing.
  - $t_{CP}$  is the machine cycle period (unit : ns) .

### • Internal shift clock mode

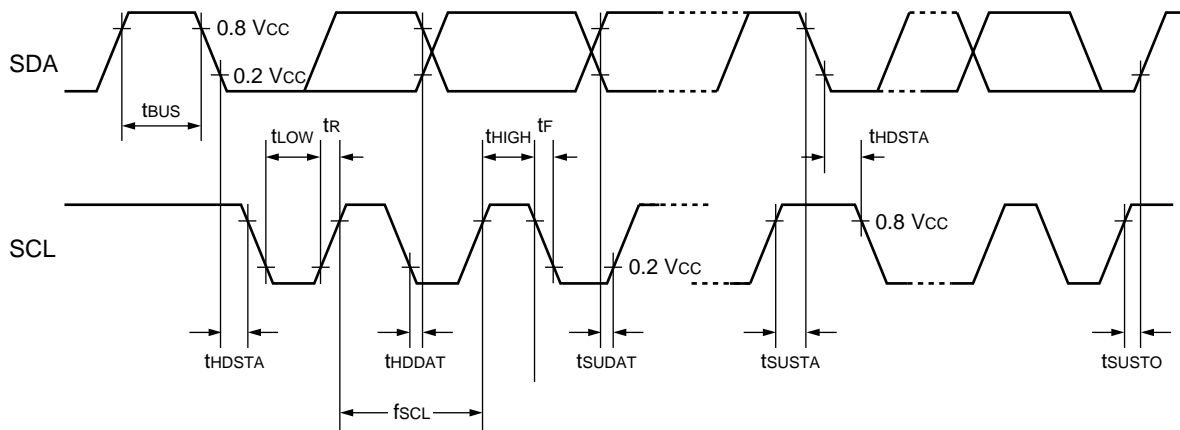

### • External shift clock mode

## (5) I<sup>2</sup>C timing

(V<sub>CC</sub> = 3.3 V ± 0.3 V, V<sub>SS</sub> = 0.0 V, T<sub>A</sub> = -40 °C to +85 °C)

Parameter	Sym- bol	Pin name	Condi- tions	Value		Unit	Remarks
				Min	Max		
SCL clock frequency	f <sub>SCL</sub>	—	—	0	100	kHz	
Bus-free time between stop and start conditions	t <sub>BUS</sub>	—		4.7	—	μs	
Hold time (resend) start	t <sub>HDSTA</sub>	—		4.0	—	μs	The first clock pulse is generated immediately after the period.
SCL clock "L" status hold time	t <sub>LOW</sub>	—		4.7	—	μs	
SCL clock "H" status hold time	t <sub>HIGH</sub>	—		4.0	—	μs	
Resend start condition setup time	t <sub>SUSTA</sub>	—		4.7	—	μs	
Data hold time	t <sub>HDDAT</sub>	—		0	—	μs	
Data set-up time	t <sub>SUDAT</sub>	—		40	—	ns	
SDA and SCL signal rise time	t <sub>R</sub>	—		—	1000	ns	
SDA and SCL signal fall time	t <sub>F</sub>	—		—	300	ns	
Stop condition setup time	t <sub>SUSTO</sub>	—		4.0	—	μs	

## (6) Timer Input Timing

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Pin name	Condi- tions	Value		Unit	Remarks
				Min	Max		
Input pulse width	$t_{TIWH}$ $t_{TIWL}$	PWC	—	$4\ t_{CP}$	—	ns	

## (7) Timer output timing

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Sym- bol	Pin name	Condi- tions	Value		Unit	Remarks
				Min	Max		
CLK $\uparrow \rightarrow T_{OUT}$ change time PPG0 to PPG3 change time	$t_{TO}$	PPGx	—	30	—	ns	

## (8) Trigger Input Timing

( $T_A = -40\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Pin name	Condi- tions	Value		Unit	Remarks
				Min	Max		
Input pulse width	$t_{TRGH}$	INTx	—	$5\ t_{CP}$	—	ns	At normal operating
	$t_{TRGL}$			1	—	$\mu\text{s}$	At Stop mode

## 5. USB characteristics

( $T_A = 0\text{ }^{\circ}\text{C}$  to  $+70\text{ }^{\circ}\text{C}$ ,  $V_{CC} = 3.3\text{ V} \pm 0.3\text{ V}$ ,  $V_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Sym bol	Value		Unit	Remarks
			Min	Max		
Input characteristics	Input High level voltage	$V_{IH}$	2.0	—	V	
	Input Low level voltage	$V_{IL}$	—	0.8	V	
	Differential input sensitivity	$V_{DI}$	0.2	—	V	
	Differential common mode range	$V_{CM}$	0.8	2.5	V	
Output characteristics	Output High level voltage	$V_{OH}$	2.8	3.6	V	$I_{OH} = -200\text{ }\mu\text{A}$
	Output Low level voltage	$V_{OL}$	0.0	0.3	V	$I_{OL} = 2\text{ mA}$
	Cross over voltage	$V_{CRS}$	1.3	2.0	V	
	Rise time	$t_{FR}$	4	20	ns	Full Speed
		$t_{LR}$	75	300	ns	Low Speed
	Fall time	$t_{FF}$	4	20	ns	Full Speed
		$t_{LF}$	75	300	ns	Low Speed
	Rising/falling time matching	$t_{RFM}$	90	111.11	%	( $T_{FR}/T_{FF}$ )
		$t_{RLM}$	80	125	%	( $T_{LR}/T_{LF}$ )
	Output registance	$Z_{DRV}$	28	44	$\Omega$	Including $R_s = 27\text{ }\Omega$

## ■ ORDERING INFORMATION

- MB90335 Series

Part number	Package	Remarks
MB90F337PFM MB90337PFM	64-pin plastic LQFP (FPT-64P-M09)	

## ■ PACKAGE DIMENSION

64-pin plastic LQFP  
(FPT-64P-M09)

Note 1) \* : These dimensions do not include resin protrusion.  
Note 2) Pins width and pins thickness include plating thickness.  
Note 3) Pins width do not include tie bar cutting remainder.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
