262,144-word \times 16-bit Dynamic Random Access Memory

HITACHI

ADE-203-260A (Z)

Rev. 1.0

Jun. 12, 1995

Description

The Hitachi HM51(S)4260C is CMOS dynamic RAM organized as 262,144-word \times 16-bit. HM51(S)4260C has realized higher density, higher performance and various functions by employing 0.8 μ m CMOS process technology and some new CMOS circuit design technologies. The HM51(S)4260C offers fast page mode as a high speed access mode. Multiplexed address input permits the HM51(S)4260C to be packaged in standard 400-mil 40-pin plastic SOJ and standard 400-mil 44-pin plastic TSOPII. Internal refresh timer enables HM51S4260C self refresh operation.

Features

- Single 5 V ($\pm 10\%$) (HM51(S)4260C-6/7/8)
($\pm 5\%$) (HM51(S)4260C-6R)
- High speed
 - Access time: 60 ns/70 ns/80 ns (max)
- Low power dissipation
 - Active mode: 825 mW/788 mW/770 mW/688 mW (max)
 - Standby mode: 11 mW (max) (HM51(S)4260C-6/7/8)
10.5 mW (max) (HM51(S)4260C-6R)
1.1 mW (max) (L-version) (HM51(S)4260C-6/7/8)
1.05 mW (max) (L-version) (HM51(S)4260C-6R)
- Fast page mode capability
- 512 refresh cycles: 8 ms
128 ms (L-version)
- 2 $\overline{\text{CAS}}$ -byte control
- 2 variations of refresh
 - $\overline{\text{RAS}}$ -only refresh
 - $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh
- Battery backup operation (L-version)
- Self refresh operation (HM51S4260C)

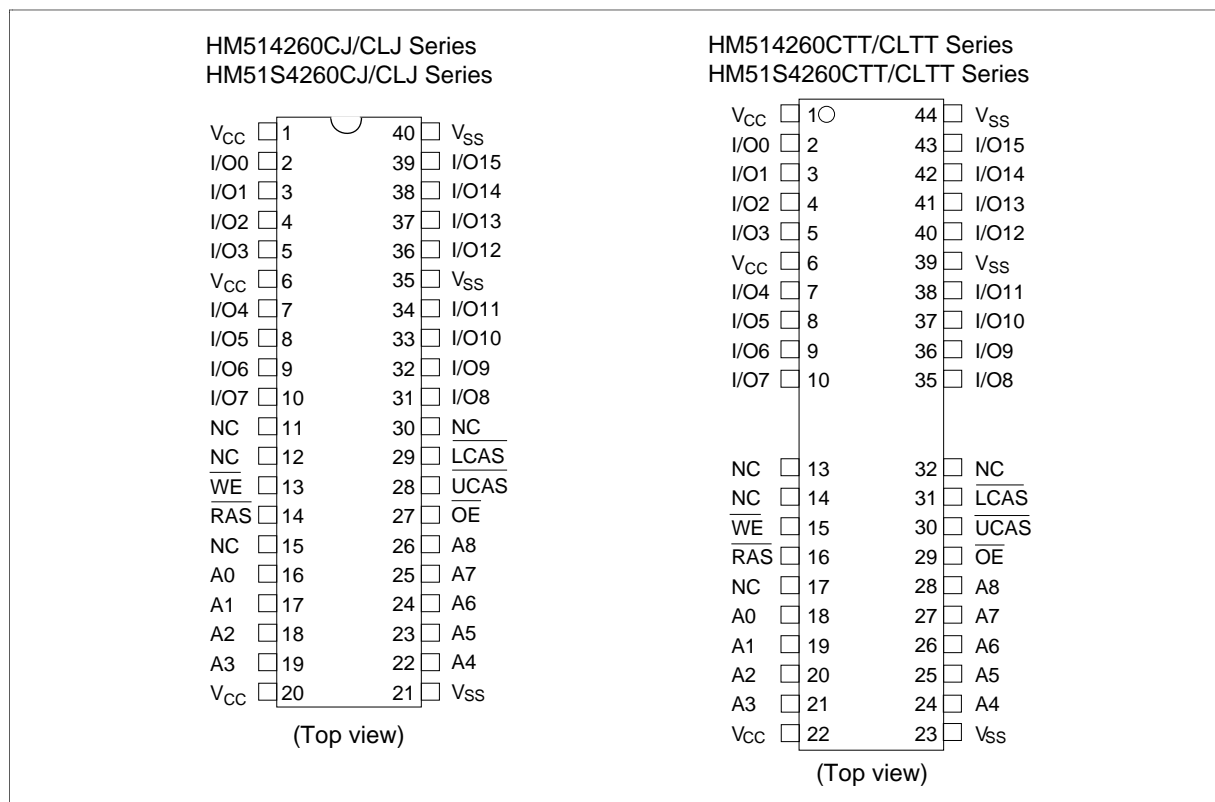

HM514260C, HM51S4260C Series

Ordering Information

Pin Arrangement

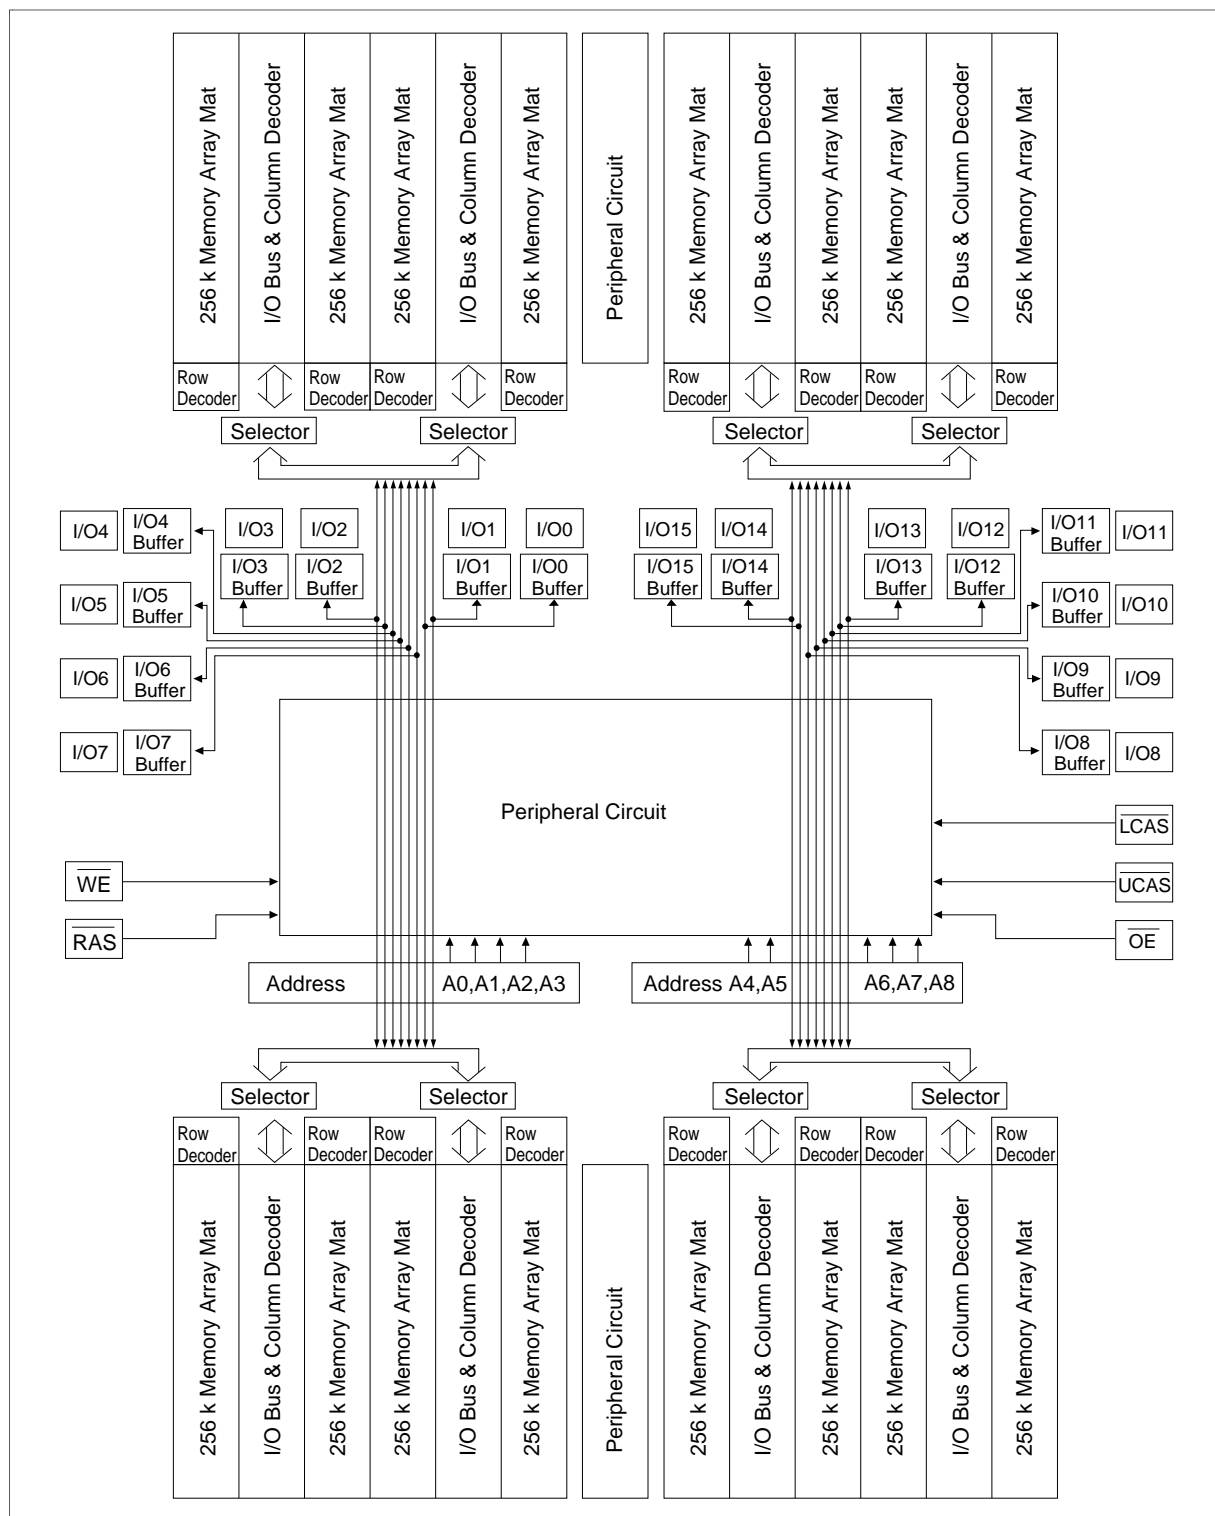

Pin Description

Pin Name	Function
A0 to A8	Address input –Row address A0 to A8 –Column address A0 to A8 –Refresh address A0 to A8
I/O0 to I/O15	Data-in/data-out
$\overline{\text{RAS}}$	Row address strobe
$\overline{\text{UCAS}}, \overline{\text{LCAS}}$	Column address strobe
$\overline{\text{WE}}$	Read/write enable
$\overline{\text{OE}}$	Output enable
V_{CC}	Power (+5 V)
V_{SS}	Ground
NC	No connection

HM514260C, HM51S4260C Series

Block Diagram

HM514260C, HM51S4260C Series

Operation Mode

The HM51(S)4260C series has the following 11 operation modes.

1. Read cycle
2. Early write cycle
3. Delayed write cycle
4. Read- modify-write cycle
5. $\overline{\text{RAS}}$ -only refresh cycle
6. $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle
7. Self refresh cycle(HM51S4260C)
8. Fast page mode read cycle
9. Fast page mode early write cycle
10. Fast page mode delayed write cycle
11. Fast page mode read- modify-write cycle

Inputs

RAS	LCAS	UCAS	WE	OE	Output	Operation
H	H	H	D	D	Open	Standby
H	L	L	H	L	Valid	Standby
L	L	L	H	L	Valid	Read cycle
L	L	L	L* ²	D	Open	Early write cycle
L	L	L	L* ²	H	Undefined	Delayed write cycle
L	L	L	H to L	L to H	Valid	Read-modify-write cycle
L	H	H	D	D	Open	$\overline{\text{RAS}}$ -only refresh cycle
H to L	H	L	D	D	Open	$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle
	L	H				Self refresh cycle (HM51S4260C)
	L	L				
L	H to L	H to L	H	L	Valid	Fast page mode read cycle
L	H to L	H to L	L* ²	D	Open	Fast page mode early write cycle
L	H to L	H to L	L* ²	H	Undefined	Fast page mode delayed write cycle
L	H to L	H to L	H to L	L to H	Valid	Fast page mode read-modify-write cycle
L	L	L	H	H	Open	Read cycle (Output disabled)

Notes: 1. H: High(inactive) L: Low(active) D: H or L

2. $t_{\text{WCS}} \geq 0$ ns Early write cycle

$t_{\text{WCS}} < 0$ ns Delayed write cycle

3. Mode is determined by the OR function of the $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$. (Mode is set by the earliest of $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ active edge and reset by the latest of $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ inactive edge.) However write OPERATION and output HIZ control are done independently by each $\overline{\text{UCAS}}$, $\overline{\text{LCAS}}$.

ex. if $\overline{\text{RAS}} = \text{H to L}$, $\overline{\text{LCAS}} = \text{L}$, $\overline{\text{UCAS}} = \text{H}$, then $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle is selected.

HM514260C, HM51S4260C Series

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V_{SS}	V_T	-1.0 to +7.0	V
Supply voltage relative to V_{SS}	V_{CC}	-1.0 to +7.0	V
Short circuit output current	I_{out}	50	mA
Power dissipation	P_T	1.0	W
Operating temperature	T_{opr}	0 to +70	°C
Storage temperature	T_{stg}	-55 to +125	°C

Recommended DC Operating Conditions ($T_a = 0$ to +70°C)*²

Parameter	Symbol	Min	Typ	Max	Unit	Notes
Supply voltage	V_{SS}	0	0	0	V	2
	V_{CC} (HM51(S)4260C-6/7/8)	4.5	5.0	5.5	V	1, 2
	V_{CC} (HM51(S)4260C-6R)	4.75	5.0	5.25	V	1, 2
Input high voltage	V_{IH}	2.4	—	6.5	V	1
Input low voltage	V_{IL}	-1.0	—	0.8	V	1

Notes: 1. All voltage referred to V_{SS} .

2. The supply voltage with all V_{CC} pins must be on the same level.

The supply voltage with all V_{SS} pins must be on the same level.

HM514260C, HM51S4260C Series

Self refresh Mode

		HM51S4260C							
		-6/-6R		-7		-8			
Parameter	Symbol	Min	Max	Min	Max	Min	Max	Unit	Notes
$\overline{\text{RAS}}$ pulse width (self refresh)	t _{RASS}	100	—	100	—	100	—	μs	24, 25, 26
$\overline{\text{RAS}}$ precharge time (self refresh)	t _{RPS}	110	—	130	—	150	—	ns	
$\overline{\text{CAS}}$ hold time (self refresh)	t _{CHS}	−50	—	−50	—	−50	—	ns	21

Notes: 1. AC measurements assume $t_T = 5 \text{ ns}$.

- Assumes that $t_{\text{RCD}} \leq t_{\text{RCD}} (\text{max})$ and $t_{\text{RAD}} \leq t_{\text{RAD}} (\text{max})$. If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
- Measured with a load circuit equivalent to 2 TTL loads and 100 pF (HM51(S)4260C-6/7/8), 2 TTL 50 pF (HM51(S)4260C-6R).
- Assumes that $t_{\text{RCD}} \geq t_{\text{RCD}} (\text{max})$ and $t_{\text{RAD}} \leq t_{\text{RAD}} (\text{max})$.
- Assumes that $t_{\text{RCD}} \leq t_{\text{RCD}} (\text{max})$ and $t_{\text{RAD}} \geq t_{\text{RAD}} (\text{max})$.
- $t_{\text{OFF}} (\text{max})$ defines the time at which the output achieves the open circuit condition and is not referred to output voltage levels.
- $V_{\text{IH}} (\text{min})$ and $V_{\text{IL}} (\text{max})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- Operation with the $t_{\text{RCD}} (\text{max})$ limit insures that $t_{\text{RAC}} (\text{max})$ can be met, $t_{\text{RCD}} (\text{max})$ is specified as a reference point only, if t_{RCD} is greater than the specified $t_{\text{RCD}} (\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .
- Operation with the $t_{\text{RAD}} (\text{max})$ limit insures that $t_{\text{RAC}} (\text{max})$ can be met, $t_{\text{RAD}} (\text{max})$ is specified as a reference point only, if t_{RAD} is greater than the specified $t_{\text{RAD}} (\text{max})$ limit, then access time is controlled exclusively by t_{AA} .
- t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only: if $t_{\text{WCS}} \geq t_{\text{WCS}} (\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{\text{RWD}} \geq t_{\text{RWD}} (\text{min})$, $t_{\text{CWD}} \geq t_{\text{CWD}} (\text{min})$, $t_{\text{AWD}} \geq t_{\text{AWD}} (\text{min})$ and $t_{\text{CPW}} \geq t_{\text{CPW}} (\text{min})$, the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
- These parameters are referred to $\overline{\text{CAS}}$ leading edge in an early write cycle and to $\overline{\text{WE}}$ leading edge in a delayed write or a read-modify-write cycle.
- t_{RASC} defines $\overline{\text{RAS}}$ pulse width in fast page mode cycles.
- Access time is determined by the longest among t_{AA} , t_{CAC} and t_{ACP} .
- An initial pause of 100 μs is required after power up followed by a minimum of eight initialization cycles (RAS-only refresh cycle or $\overline{\text{CAS}}$ -before-RAS refresh cycle). If the internal refresh counter is used, a minimum of eight $\overline{\text{CAS}}$ -before-RAS refresh cycles is required.
- In delayed write or read-modify-write cycles, $\overline{\text{OE}}$ must disable output buffer prior to applying data to the device.
- Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- When both $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ go low at the same time, all 16-bits data are written into the device. $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$ cannot be staggered within the same write/read cycles.
- All the V_{CC} and V_{SS} pins shall be supplied with the same voltages.
- t_{ASC} , t_{CAH} , t_{RCS} , t_{WCS} , t_{WCH} , t_{CSR} and t_{RPC} are determined by the earlier falling edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
- t_{CRP} , t_{CHR} , t_{ACP} , t_{RCH} and t_{CPW} are determined by the later rising edge of $\overline{\text{UCAS}}$ or $\overline{\text{LCAS}}$.
- t_{CWL} , t_{DH} , t_{DS} and t_{CHS} should be satisfied by both $\overline{\text{UCAS}}$ and $\overline{\text{LCAS}}$.

22. t_{CPN} and t_{CP} are determined by the time that both \overline{UCAS} and \overline{LCAS} are high.
23. When output buffers are enabled once, sustain the low impedance state until valid data is obtained. When output buffer is turned on and off within a very short time, generally it causes large V_{CC}/V_{SS} line noise, which causes to degrade $V_{IH\ min}/V_{IL\ max}$ level.
24. If you use distributed CBR refresh mode with 15.6 μs interval in normal read/write cycle, CBR refresh should be executed within 15.6 μs immediately after exiting from and before entering into self refresh mode.
25. If you use \overline{RAS} only refresh or CBR burst refresh mode in normal read/write cycle, 512 cycles of distributed CBR refresh with 15.6 μs interval should be executed within 8 ms immediately after exiting from and before entering into the self refresh mode.
26. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.
27.  H or L (H: $V_{IH\ (min)} \leq V_{IN} \leq V_{IH\ (max)}$, L: $V_{IL\ (min)} \leq V_{IN} \leq V_{IL\ (max)}$)
 Invalid Dout

Notes concerning $\overline{2CAS}$ control

Please do not separate the $\overline{UCAS}/\overline{LCAS}$ operation timing intentionally. However skew between $\overline{UCAS}/\overline{LCAS}$ are allowed under the following conditions.

- (1) Each of the $\overline{UCAS}/\overline{LCAS}$ should satisfy the timing specifications individually.
- (2) Different operation mode for upper/lower byte is not allowed; such as following.

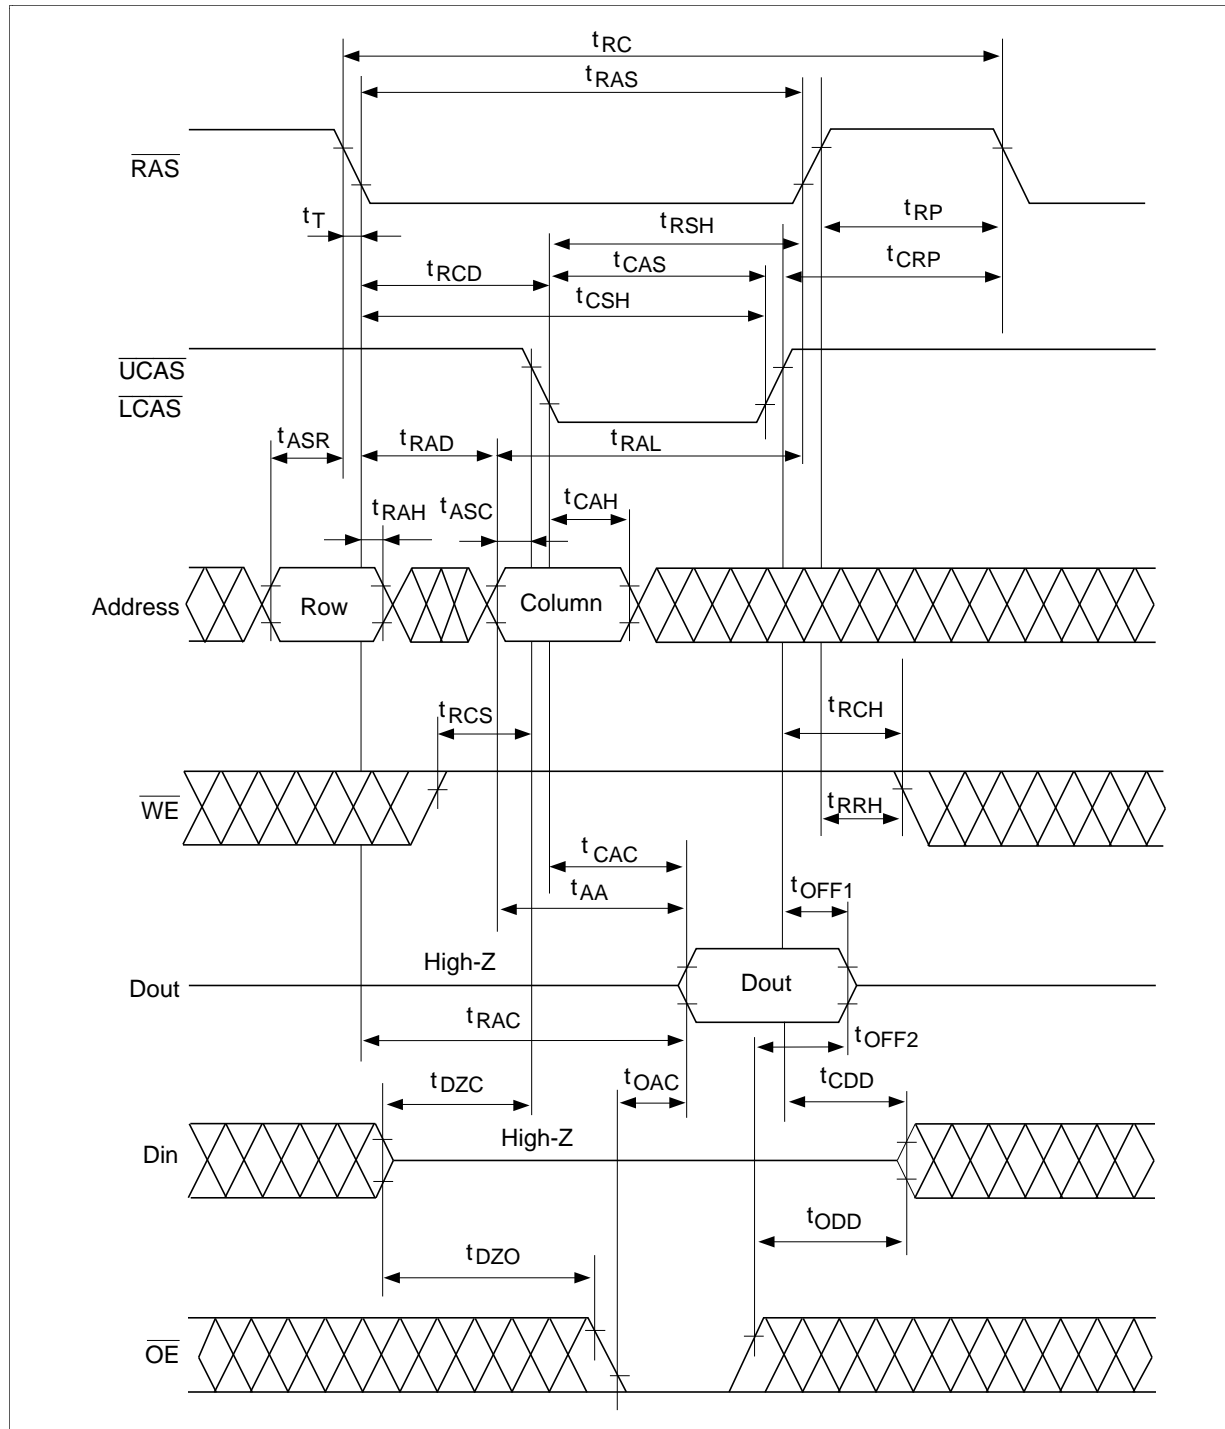

- (3) Closely separated upper/lower byte control is not allowed. However when the condition ($t_{CP} \leq t_{UL}$) is satisfied, fast page mode can be performed.

Self Refresh Cycle

* $\overline{WE}, \overline{OE}$: H or L

The low self refresh current is achieved by introducing extremely long internal refresh cycle. Therefore some care needs to be taken on the refresh.

1. Please do not use t_{RASS} timing, $10 \mu s \leq t_{RASS} \leq 100 \mu s$. During this period, the device is in transition state from normal operation mode to self refresh mode. If $t_{RASS} \geq 100 \mu s$, then \overline{RAS} precharge time should use t_{RPS} instead of t_{RP} .
2. If you use \overline{RAS} only refresh or CBR burst refresh mode in normal read/write cycle, 512 cycles of distributed CBR refresh with $15.6 \mu s$ interval should be executed within 8 ms immediately after exiting from and before entering into the self refresh mode.
3. If you use distributed CBR refresh mode with $15.6 \mu s$ interval in normal read/write cycle, CBR refresh should be executed within $15.6 \mu s$ immediately after exiting from and before entering into self refresh mode.
4. Repetitive self refresh mode without refreshing all memory is not allowed. Once you exit from self refresh mode, all memory cells need to be refreshed before re-entering the self refresh mode again.
