

DESCRIPTION

The HI-1567 and HI-1568 are low power CMOS dual transceivers designed to meet the requirements of MIL-STD-1553/1760 specifications.

The transmitter section of each channel takes complementary CMOS / TTL digital input data and converts it to bi-phase Manchester encoded 1553 signals suitable for driving the bus isolation transformer. Separate transmitter inhibit control signals are provided for each transmitter.

The receiver section of the each channel converts the 1553 bus bi-phase data to complementary CMOS / TTL data suitable for inputting to a Manchester decoder. Each receiver has a separate enable input which can be used to force the output of the receiver to a logic 0 (HI-1567) or logic 1 (HI-1568).

To minimize the package size for this function, the transmitter outputs are internally connected to the receiver inputs, so that only two pins are required for connection to each coupling transformer. For designs requiring independent access to transmitter and receiver 1553 signals, please refer to the HI-1569 data sheet.

FEATURES

- Compliant to MIL-STD-1553A & B, MIL-STD-1760, ARINC 708A
- CMOS technology for low standby power
- Smallest footprint available in 44-pin plastic chip-scale package with integral heatsink
- Less than 1.0W maximum power dissipation
- Radiation tolerant
- Also available in DIP and small outline (ESQIC) package options
- Military processing options
- Industry standard pin configurations

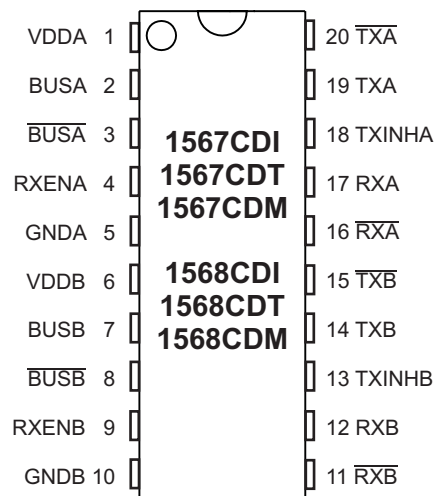

PIN CONFIGURATIONS

**44 Pin Plastic 7mm x 7mm

FUNCTIONAL DESCRIPTION

The HI-1567 family of data bus transceivers contain differential voltage source drivers and differential receivers. They are intended for applications using a MIL-STD-1553 A/B data bus. The device produces a trapezoidal output waveform during transmission.

TRANSMITTER

Data input to the device's transmitter section is from the complementary CMOS /TTL inputs TXA/B and $\overline{TXA/B}$. The transmitter accepts Manchester II bi-phase data and converts it to differential voltages on BUSA/B and $\overline{BUSA/B}$. The transceiver outputs are either direct or transformer coupled to the MIL-STD-1553 data bus. Both coupling methods produce a nominal voltage on the bus of 7.5 volts peak to peak.

The transmitter is automatically inhibited and placed in the high impedance state when both TXA/B and $\overline{TXA/B}$ are either at a logic "1" or logic "0" simultaneously. A logic "1" applied to the TXINH A/B input will force the transmitter to the high impedance state, regardless of the state of TXA/B and $\overline{TXA/B}$.

RECEIVER

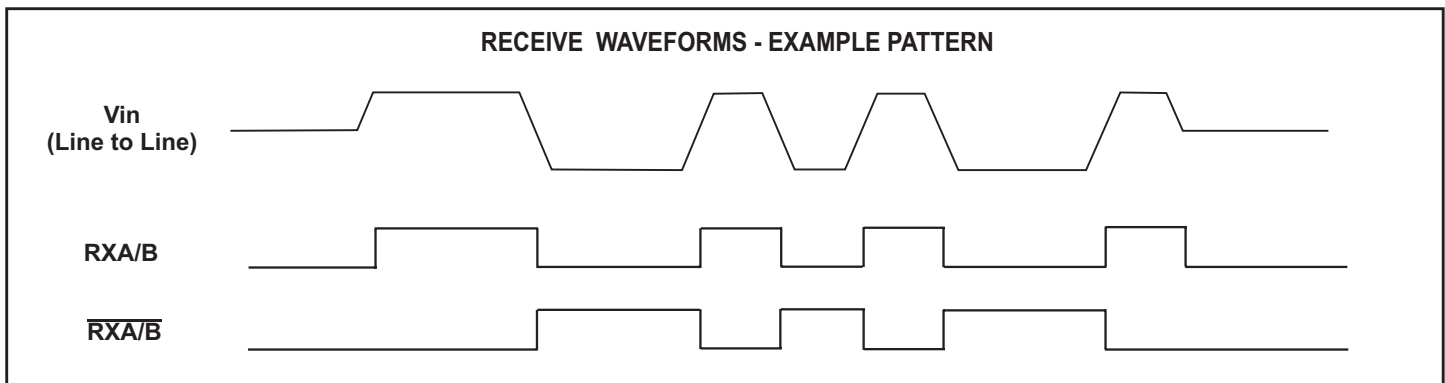

The receiver accepts bi-phase differential data from the MIL-STD-1553 bus through the same direct or transformer coupled interface as the transmitter. The receiver's differential input stage drives a filter and threshold comparator that produces CMOS/TTL data at the RXA/B and $\overline{RXA/B}$ output pins.

Each set of receiver outputs can be independently forced to a logic "0" (HI-1567) or logic "1" (HI-1568) by setting RXENA or RXENB low.

MIL-STD-1553 BUS INTERFACE

A direct coupled interface (see Figure 2) uses a 1:2.5 ratio isolation transformer and two 55 ohm isolation resistors between the transformer and the bus.

In a transformer coupled interface (see Figure 3), the transceiver is connected to a 1:1.79 isolation transformer which in turn is connected to a 1:1.4 coupling transformer. The transformer coupled method also requires two coupling resistors equal to 75% of the bus characteristic impedance (Z_0) between the coupling transformer and the bus.

HEAT SINK - ESOIC PACKAGE

Both the HI-1567PSI/T and HI-1568PSI/T use a 20-pin thermally enhanced SOIC package. The package includes a metal heat sink located on the bottom surface of the device. This heat sink should be soldered down to

the printed circuit board for optimum thermal dissipation. The heat sink is electrically connected to the VDD supply of the chip and therefore must be isolated from all other signals.

RADIATION TOLERANCE

The HI-1567 has been characterized for total dose radiation performance in accordance with MIL-STD-883 method 1019. The part meets all data sheet parameters after exposure to 25 KRad(Si).

APPLICATIONS NOTE

Holt Applications Note AN-500 provides circuit design notes regarding the use of Holt's family of MIL-STD-1553 transceivers. Layout considerations, as well as recommended interface and protection components are included.
