## 4M x 4 (16-MBIT) DYNAMIC RAM WITH EDO PAGE MODE

### FEATURES

- Extended Data-Out (EDO) Page Mode access cycle
- TTL compatible inputs and outputs
- Refresh Interval:
  - 2,048 cycles/32 ms
  - 4,096 cycles/64 ms
- Refresh Mode:  $\overline{\text{RAS}}$ -Only,  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (CBR), and Hidden
- JEDEC standard pinout
- Single power supply:
  - 5V  $\pm$  10% or 3.3V  $\pm$  10%
- Byte Write and Byte Read operation via two  $\overline{\text{CAS}}$

### DESCRIPTION

The *ICSI* 4400 Series is a 4,194,304 x 4-bit high-performance CMOS Dynamic Random Access Memory. These devices offer an accelerated cycle access called EDO Page Mode. EDO Page Mode allows 2,048 or 4096 random accesses within a single row with access cycle time as short as 20 ns per 4-bit word.

These features make the 4400 Series ideally suited for high-bandwidth graphics, digital signal processing, high-performance computing systems, and peripheral applications.

The 4400 Series is packaged in a 24-pin 300mil SOJ and a 24 pin TSOP-2

### PRODUCT SERIES OVERVIEW

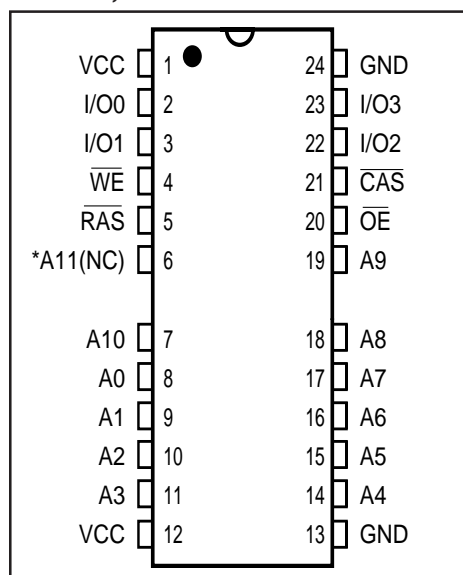

Part No.	Refresh	Voltage
IS41C44002	2K	5V $\pm$ 10%
IS41C44004	4K	5V $\pm$ 10%
IS41LV44002	2K	3.3V $\pm$ 10%
IS41LV44004	4K	3.3V $\pm$ 10%

### KEY TIMING PARAMETERS

Parameter	-50	-60	Unit
RAS Access Time ( $t_{\text{RAC}}$ )	50	60	ns
CAS Access Time ( $t_{\text{CAC}}$ )	13	15	ns
Column Address Access Time ( $t_{\text{AA}}$ )	25	30	ns
EDO Page Mode Cycle Time ( $t_{\text{PC}}$ )	20	25	ns
Read/Write Cycle Time ( $t_{\text{RC}}$ )	84	104	ns

### PIN CONFIGURATION

#### 24 Pin SOJ, TSOP-2

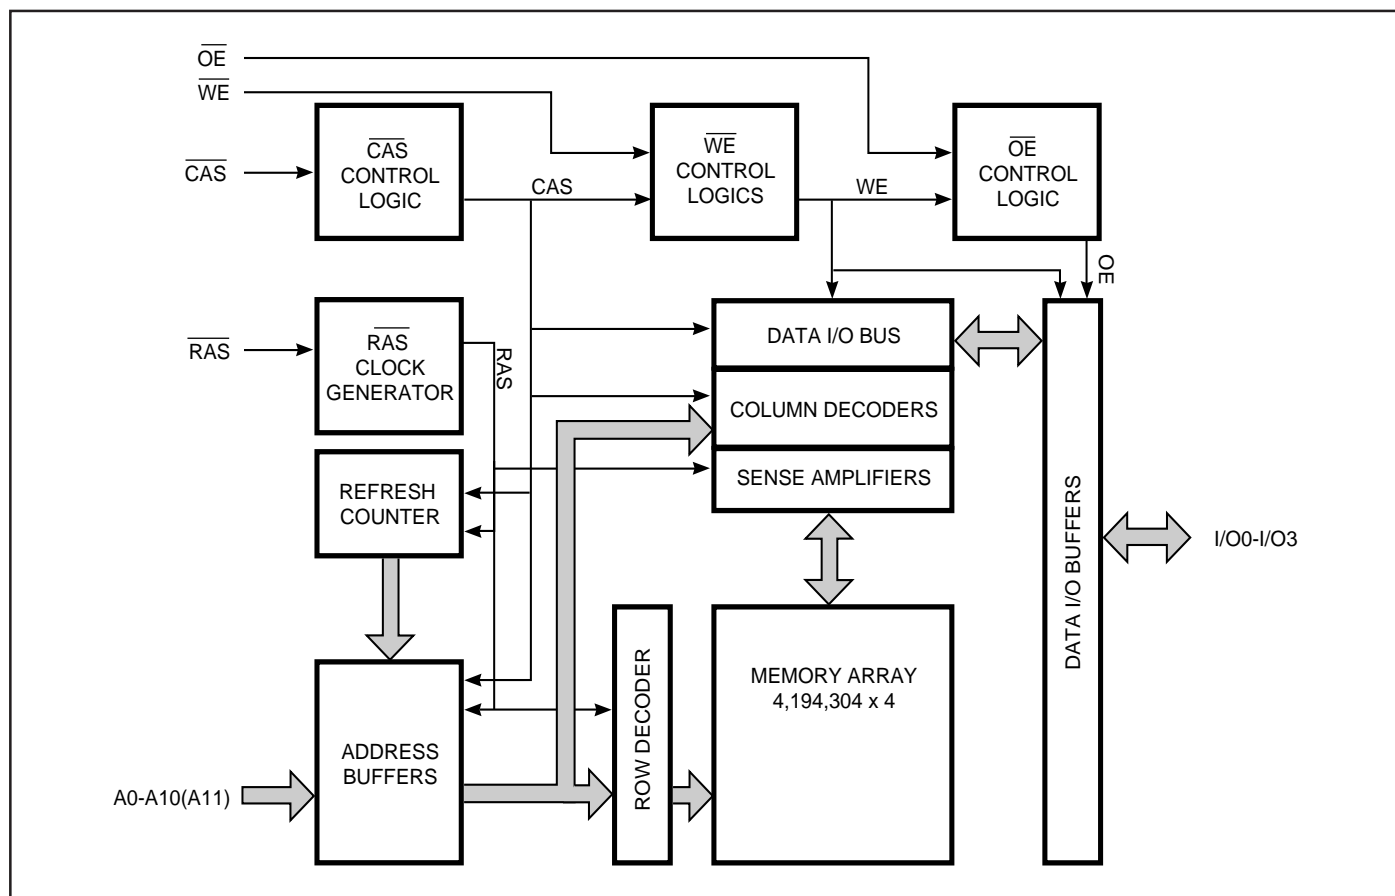

### PIN DESCRIPTIONS

A0-A11	Address Inputs (4K Refresh)
A0-A10	Address Inputs (2K Refresh)
I/O0-3	Data Inputs/Outputs
$\overline{\text{WE}}$	Write Enable
$\overline{\text{OE}}$	Output Enable
$\overline{\text{RAS}}$	Row Address Strobe
$\overline{\text{CAS}}$	Column Address Strobe
Vcc	Power
GND	Ground
NC	No Connection

\* A11 is NC for 2K Refresh devices.

## FUNCTIONAL BLOCK DIAGRAM

## TRUTH TABLE

Function		RAS	CAS	WE	OE	Address tr/tc	I/O
Standby		H	H	X	X	X	High-Z
Read		L	L	H	L	ROW/COL	DOUT
Write: Word (Early Write)		L	L	L	X	ROW/COL	DIN
Read-Write		L	L	H→L	L→H	ROW/COL	DOUT, DIN
EDO Page-Mode Read	1st Cycle:	L	H→L	H	L	ROW/COL	DOUT
	2nd Cycle:	L	H→L	H	L	NA/COL	DOUT
EDO Page-Mode Write	1st Cycle:	L	H→L	L	X	ROW/COL	DIN
	2nd Cycle:	L	H→L	L	X	NA/COL	DIN
EDO Page-Mode Read-Write	1st Cycle:	L	H→L	H→L	L→H	ROW/COL	DOUT, DIN
	2nd Cycle:	L	H→L	H→L	L→H	NA/COL	DOUT, DIN
Hidden Refresh	Read	L→H→L	L	H	L	ROW/COL	DOUT
	Write <sup>(1)</sup>	L→H→L	L	L	X	ROW/COL	DOUT
RAS-Only Refresh		L	H	X	X	ROW/NA	High-Z
CBR Refresh		H→L	L	X	X	X	High-Z

**Note:**

1. EARLY WRITE only.

## Functional Description

The IC41C4400x and IC41LV4400x are CMOS DRAMs optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 11 or 12 address bits. These are entered 11 bits (A0-A10) at a time for the 2K refresh device or 12 bits (A0-A11) at a time for the 4K refresh device. The row address is latched by the Row Address Strobe ( $\overline{\text{RAS}}$ ). The column address is latched by the Column Address Strobe ( $\overline{\text{CAS}}$ ).  $\overline{\text{RAS}}$  is used to latch the first nine bits and  $\overline{\text{CAS}}$  is used the latter ten bits.

## Memory Cycle

A memory cycle is initiated by bring  $\overline{\text{RAS}}$  LOW and it is terminated by returning both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum  $t_{\text{RAS}}$  time has expired. A new cycle must not be initiated until the minimum precharge time  $t_{\text{RP}}$ ,  $t_{\text{CP}}$  has elapsed.

## Read Cycle

A read cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{OE}}$ , whichever occurs last, while holding  $\overline{\text{WE}}$  HIGH. The column address must be held for a minimum time specified by  $t_{\text{AR}}$ . Data Out becomes valid only when  $t_{\text{RAC}}$ ,  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{OEA}}$  are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

## Write Cycle

A write cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$ , whichever occurs last. The input data must be valid at or before the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{WE}}$ , whichever occurs last.

## Refresh Cycle

To retain data, 2,048 refresh cycles are required in each 32 ms period, or 4,096 refresh cycles are required in each 64ms period. There are two ways to refresh the memory:

1. By clocking each of the 2,048 row addresses (A0 through A10) or 4096 row addresses (A0 through A11) with  $\overline{\text{RAS}}$  at least once every 32 ms or 64ms respectively. Any read, write, read-modify-write or  $\overline{\text{RAS}}$ -only cycle refreshes the addressed row.
2. Using a  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle.  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh is activated by the falling edge of  $\overline{\text{RAS}}$ , while holding  $\overline{\text{CAS}}$  LOW. In  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle, an internal 9-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

## Power-On

After application of the  $V_{\text{CC}}$  supply, an initial pause of 200  $\mu\text{s}$  is required followed by a minimum of eight initialization cycles (any combination of cycles containing a  $\overline{\text{RAS}}$  signal).

During power-on, it is recommended that  $\overline{\text{RAS}}$  track with  $V_{\text{CC}}$  or be held at a valid  $V_{\text{IH}}$  to avoid current surges.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Symbol	Parameters	Rating	Unit
V <sub>T</sub>	Voltage on Any Pin Relative to GND	5V	V
		3.3V	
V <sub>CC</sub>	Supply Voltage	5V	V
		3.3V	
I <sub>OUT</sub>	Output Current	50	mA
P <sub>D</sub>	Power Dissipation	1	W
T <sub>A</sub>	Commercial Operation Temperature	0 to +70	°C
	Industrial Operation Temperature	–40 to +85	
T <sub>STG</sub>	Storage Temperature	–55 to +125	°C

### Note:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND.)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>CC</sub>	Supply Voltage	5V	4.5	5.5	V
		3.3V	3.0	3.6	
V <sub>IH</sub>	Input High Voltage	5V	2.4	–	V
		3.3V	2.0	–	
V <sub>IL</sub>	Input Low Voltage	5V	–1.0	–	V
		3.3V	–0.3	–	
T <sub>A</sub>	Commercial Ambient Temperature	0	–	70	°C
	Industrial Ambient Temperature	–40	–	85	

## CAPACITANCE<sup>(1,2)</sup>

Symbol	Parameter	Max.	Unit
C <sub>IN1</sub>	Input Capacitance: A0-A10(A11)	5	pF
C <sub>IN2</sub>	Input Capacitance: RAS, CAS, WE, OE	7	pF
C <sub>IO</sub>	Data Input/Output Capacitance: I/O0-I/O3	7	pF

### Notes:

1. Tested initially and after any design or process changes that may affect these parameters.
2. Test conditions: T<sub>A</sub> = 25°C, f = 1 MHz.

## ELECTRICAL CHARACTERISTICS<sup>(1)</sup>

(Recommended Operating Conditions unless otherwise noted.)

Symbol	Parameter	Test Condition	Speed	Min.	Max.	Unit
I <sub>IL</sub>	Input Leakage Current	Any input 0V < V <sub>IN</sub> < V <sub>CC</sub> Other inputs not under test = 0V		-5	5	μA
I <sub>IO</sub>	Output Leakage Current	Output is disabled (Hi-Z) 0V < V <sub>OUT</sub> < V <sub>CC</sub>		-5	5	μA
V <sub>OH</sub>	Output High Voltage Level	I <sub>OH</sub> = -5.0 mA with V <sub>CC</sub> =5V I <sub>OH</sub> = -2.0 mA with V <sub>CC</sub> =3.3V		2.4	-	V
V <sub>OL</sub>	Output Low Voltage Level	I <sub>OL</sub> = 4.2 mA with V <sub>CC</sub> =5V I <sub>OL</sub> = 2 mA with V <sub>CC</sub> =3.3V		-	0.4	V
I <sub>CC1</sub>	Standby Current: TTL	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ – V <sub>IH</sub>	5V 3.3V	- -	2 0.5	mA
I <sub>CC2</sub>	Standby Current: CMOS	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ > V <sub>CC</sub> – 0.2V	5V 3.3V	- -	1 0.5	mA
I <sub>CC3</sub>	Operating Current: Random Read/Write <sup>(2,3,4)</sup> Average Power Supply Current	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , Address Cycling, t <sub>RC</sub> = t <sub>RC</sub> (min.)	-50 -60	- -	120 110	mA
I <sub>CC4</sub>	Operating Current: EDO Page Mode <sup>(2,3,4)</sup> Average Power Supply Current	$\overline{\text{RAS}}$ = V <sub>IL</sub> , $\overline{\text{CAS}}$ , Cycling t <sub>PC</sub> = t <sub>PC</sub> (min.)	-50 -60	- -	90 80	mA
I <sub>CC5</sub>	Refresh Current: $\overline{\text{RAS}}$ -Only <sup>(2,3)</sup> Average Power Supply Current	$\overline{\text{RAS}}$ Cycling, $\overline{\text{CAS}}$ > V <sub>IH</sub> t <sub>RC</sub> = t <sub>RC</sub> (min.)	-50 -60	- -	120 110	mA
I <sub>CC6</sub>	Refresh Current: CBR <sup>(2,3,5)</sup> Average Power Supply Current	$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ Cycling t <sub>RC</sub> = t <sub>RC</sub> (min.)	-50 -60	- -	120 110	mA

### Notes:

1. An initial pause of 200 μs is required after power-up followed by eight  $\overline{\text{RAS}}$  refresh cycles ( $\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{\text{RAS}}$  cycles wake-up should be repeated any time the t<sub>REF</sub> refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each EDO page cycle.
5. Enables on-chip refresh and address counters.

## AC CHARACTERISTICS<sup>(1,2,3,4,5,6)</sup>

(Recommended Operating Conditions unless otherwise noted.)

Symbol	Parameter	-50		-60		Units

t <sub>T</sub>	Transition Time (Rise or Fall) <sup>(2, 3)</sup>	1	50	1	50	ns

## AC TEST CONDITIONS

Output load: Two TTL Loads and 50 pF

Input timing reference levels:  $V_{IH} = 2.4V$ ,  $V_{IL} = 0.8V$

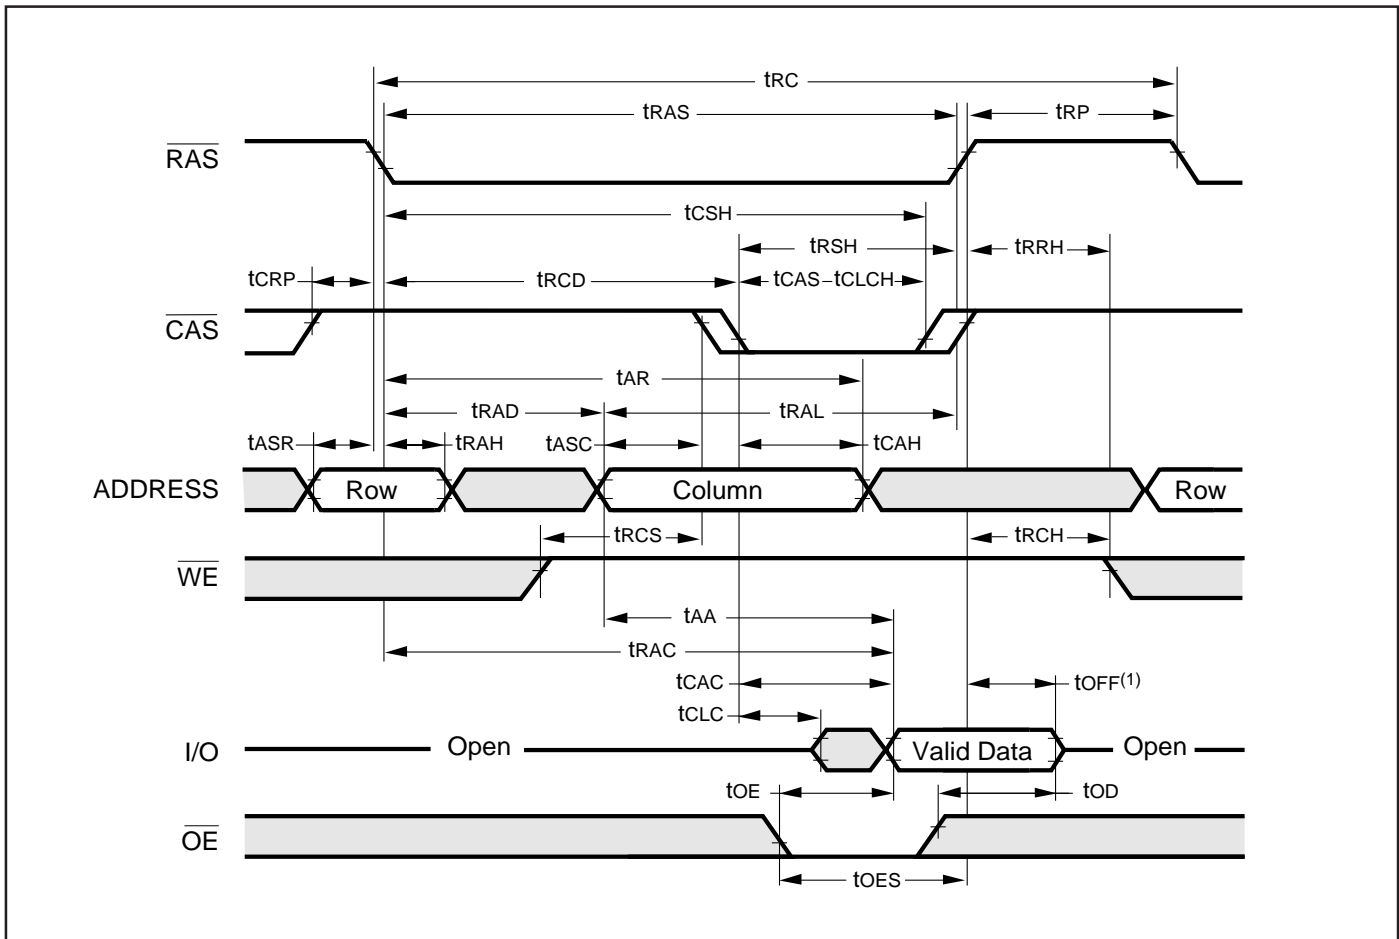

Output timing reference levels:  $V_{OH} = 2.0V$ ,  $V_{OL} = 0.8V$

## Notes:

1. An initial pause of 200  $\mu$ s is required after power-up followed by eight  $\overline{\text{RAS}}$  refresh cycle ( $\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{\text{RAS}}$  cycles wake-up should be repeated any time the  $t_{\text{REF}}$  refresh requirement is exceeded.
2.  $V_{\text{IH}}$  (MIN) and  $V_{\text{IL}}$  (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) in a monotonic manner.
4. If  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}} = V_{\text{IH}}$ , data output is High-Z.
5. If  $\overline{\text{CAS}} = V_{\text{IL}}$ , data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that  $t_{\text{RCD}} < t_{\text{RCD}} (\text{MAX})$ . If  $t_{\text{RCD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  will increase by the amount that  $t_{\text{RCD}}$  exceeds the value shown.
8. Assumes that  $t_{\text{RCD}} > t_{\text{RCD}} (\text{MAX})$ .
9. If  $\overline{\text{CAS}}$  is LOW at the falling edge of  $\overline{\text{RAS}}$ , data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer,  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  must be pulsed for  $t_{\text{CP}}$ .
10. Operation with the  $t_{\text{RCD}} (\text{MAX})$  limit ensures that  $t_{\text{RAC}} (\text{MAX})$  can be met.  $t_{\text{RCD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{CAC}}$ .
11. Operation within the  $t_{\text{RAD}} (\text{MAX})$  limit ensures that  $t_{\text{RCD}} (\text{MAX})$  can be met.  $t_{\text{RAD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{AA}}$ .
12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a READ cycle.
13.  $t_{\text{OFF}} (\text{MAX})$  defines the time at which the output achieves the open circuit condition; it is not a reference to  $V_{\text{OH}}$  or  $V_{\text{OL}}$ .
14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CWD}}$  are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If  $t_{\text{WCS}} > t_{\text{WCS}} (\text{MIN})$ , the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If  $t_{\text{RWD}} > t_{\text{RWD}} (\text{MIN})$ ,  $t_{\text{AWD}} > t_{\text{AWD}} (\text{MIN})$  and  $t_{\text{CWD}} > t_{\text{CWD}} (\text{MIN})$ , the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  or  $\overline{\text{OE}}$  go back to  $V_{\text{IH}}$ ) is indeterminate.  $\overline{\text{OE}}$  held HIGH and  $\overline{\text{WE}}$  taken LOW after  $\overline{\text{CAS}}$  goes LOW result in a LATE WRITE ( $\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding  $\overline{\text{CAS}}$  input.
16. During a READ cycle, if  $\overline{\text{OE}}$  is LOW then taken HIGH before  $\overline{\text{CAS}}$  goes HIGH, I/O goes open. If  $\overline{\text{OE}}$  is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as  $\overline{\text{WE}}$  going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both  $t_{\text{OD}}$  and  $t_{\text{OEH}}$  met ( $\overline{\text{OE}}$  HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if  $\overline{\text{CAS}}$  remains LOW and  $\overline{\text{OE}}$  is taken back to LOW after  $t_{\text{OEH}}$  is met.
19. The I/Os are in open during READ cycles once  $t_{\text{OD}}$  or  $t_{\text{OFF}}$  occur.
20. Determined by falling edge of  $\overline{\text{CAS}}$ .
21. Determined by rising edge of  $\overline{\text{CAS}}$ .
22. These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in EARLY WRITE cycles and  $\overline{\text{WE}}$  leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23.  $\overline{\text{CAS}}$  must meet minimum pulse width.
24. The 3 ns minimum is a parameter guaranteed by design.
25. Enables on-chip refresh and address counters.

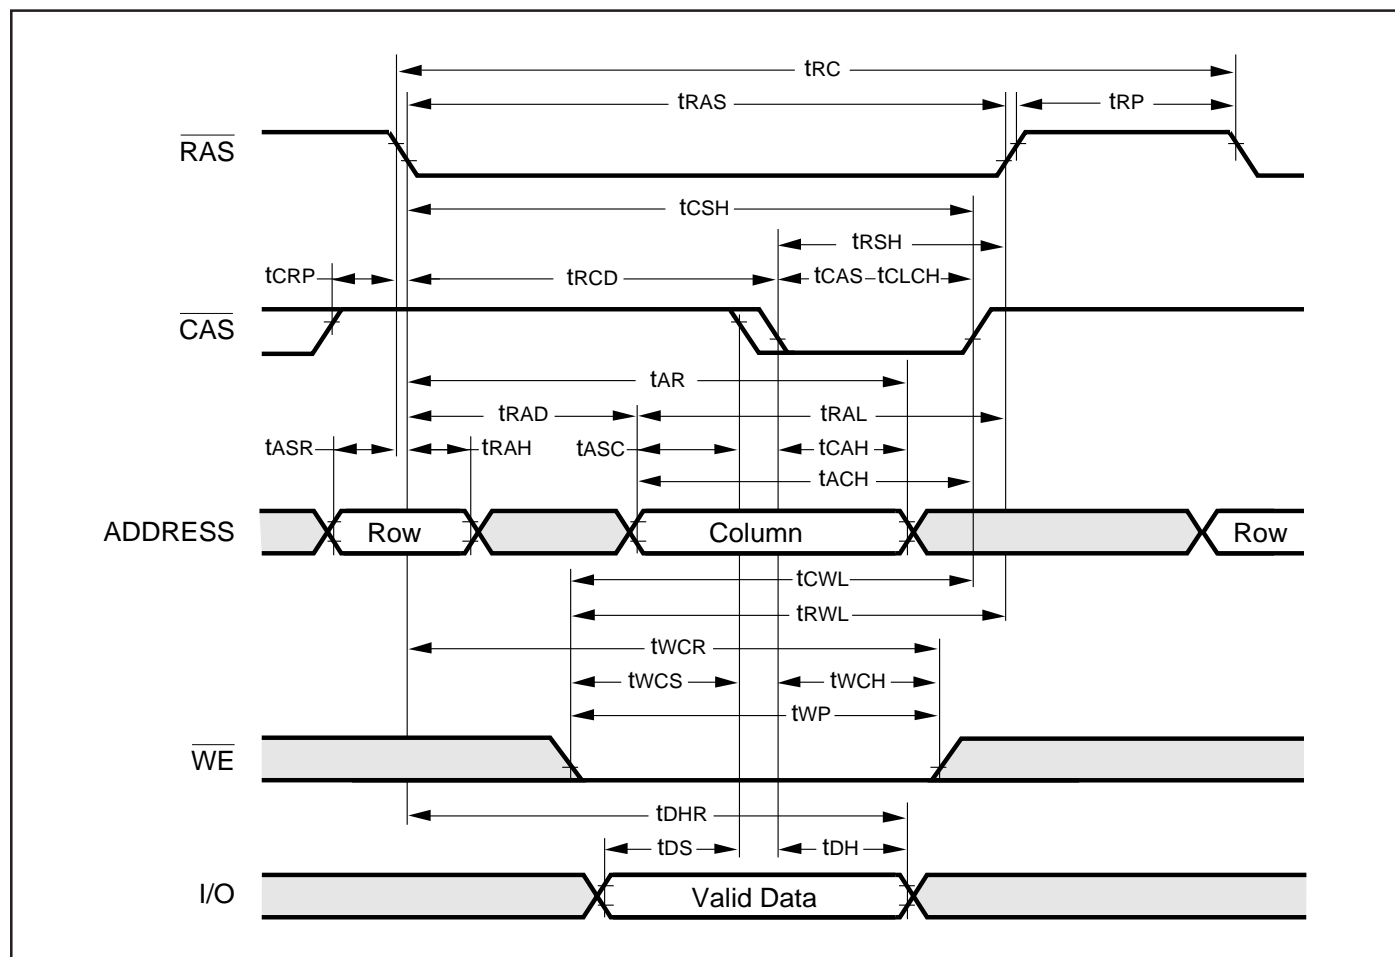

## READ CYCLE

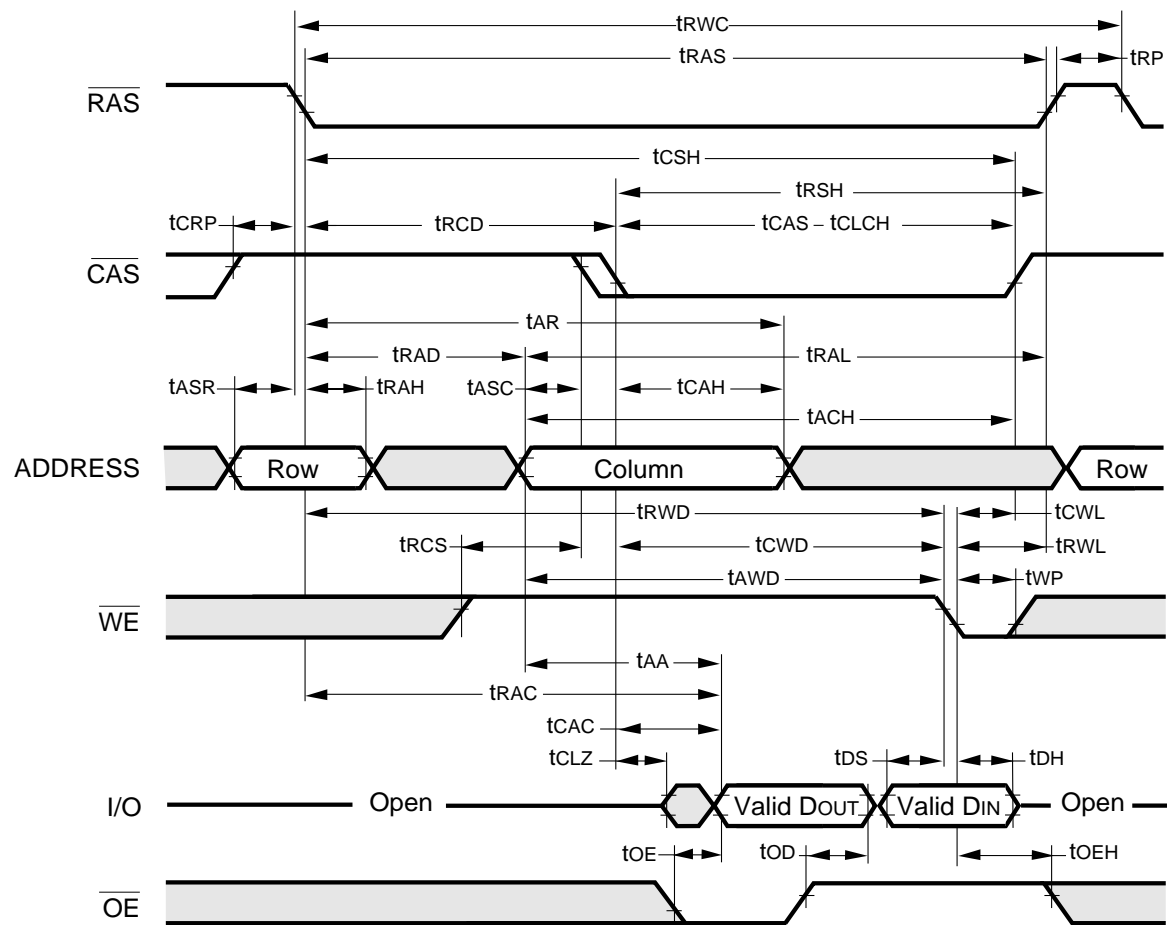

**Note:**

1.  $t_{\text{OFF}}$  is referenced from rising edge of  $\overline{\text{RAS}}$  or  $\overline{\text{CAS}}$ , whichever occurs last.

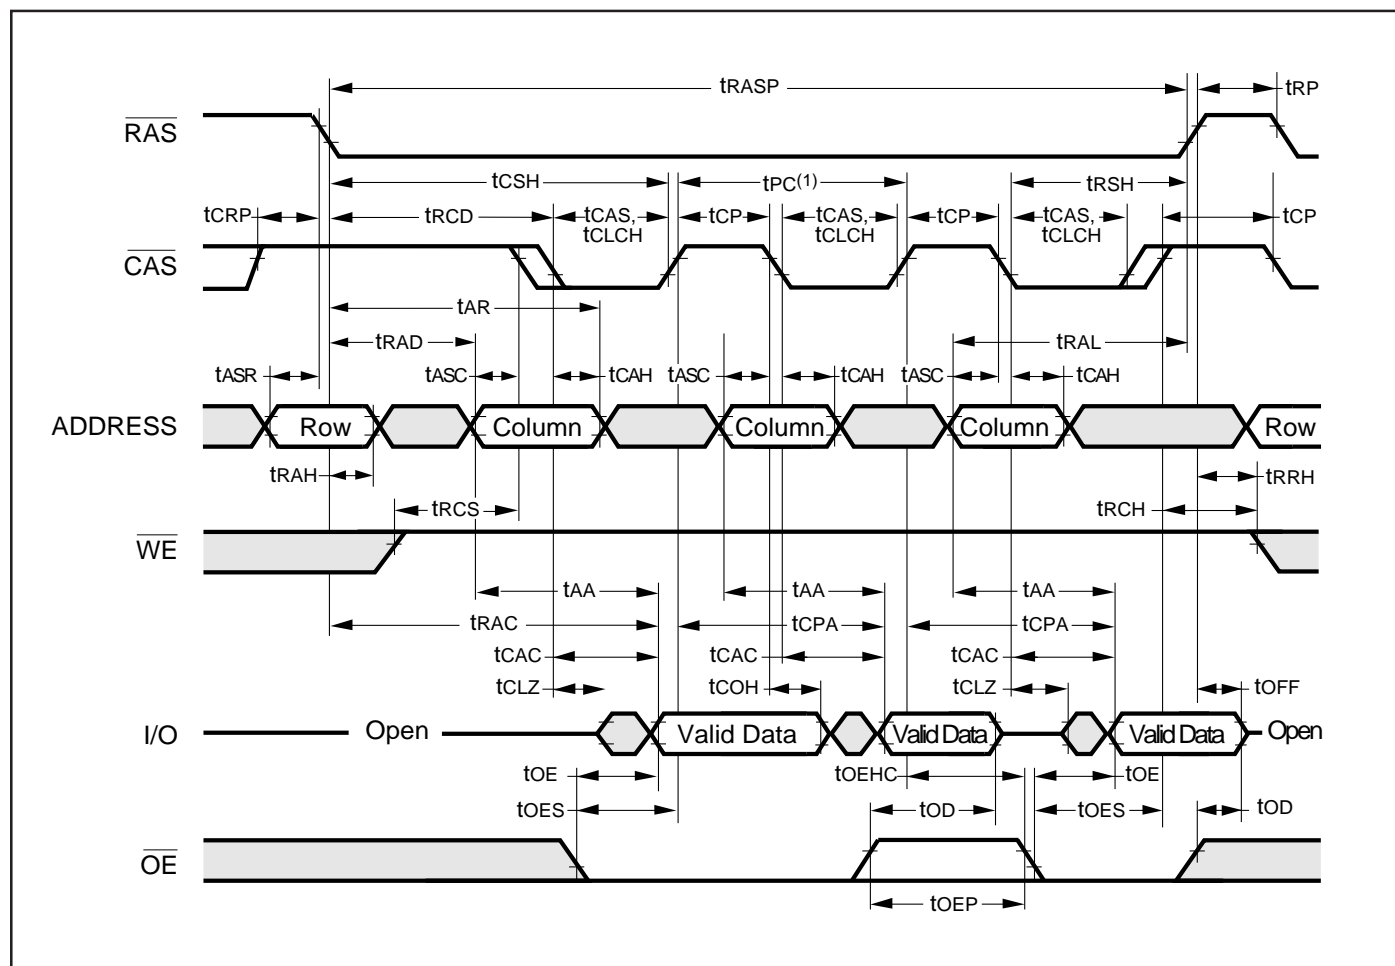

**EARLY WRITE CYCLE ( $\overline{OE}$  = DON'T CARE)**

**READ WRITE CYCLE** (LATE WRITE and READ-MODIFY-WRITE Cycles)

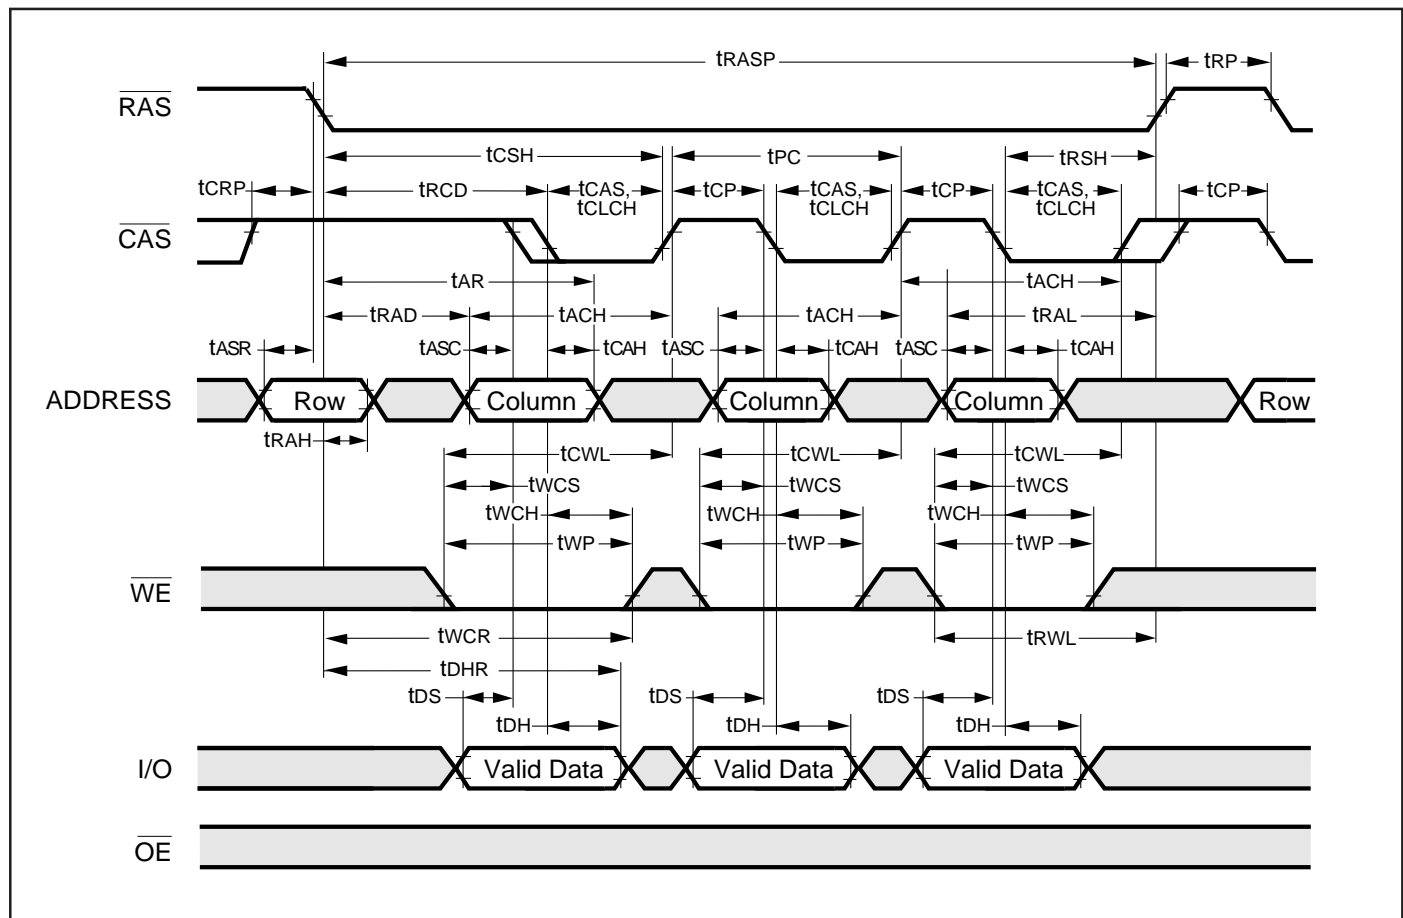

## EDO-PAGE-MODE READ CYCLE

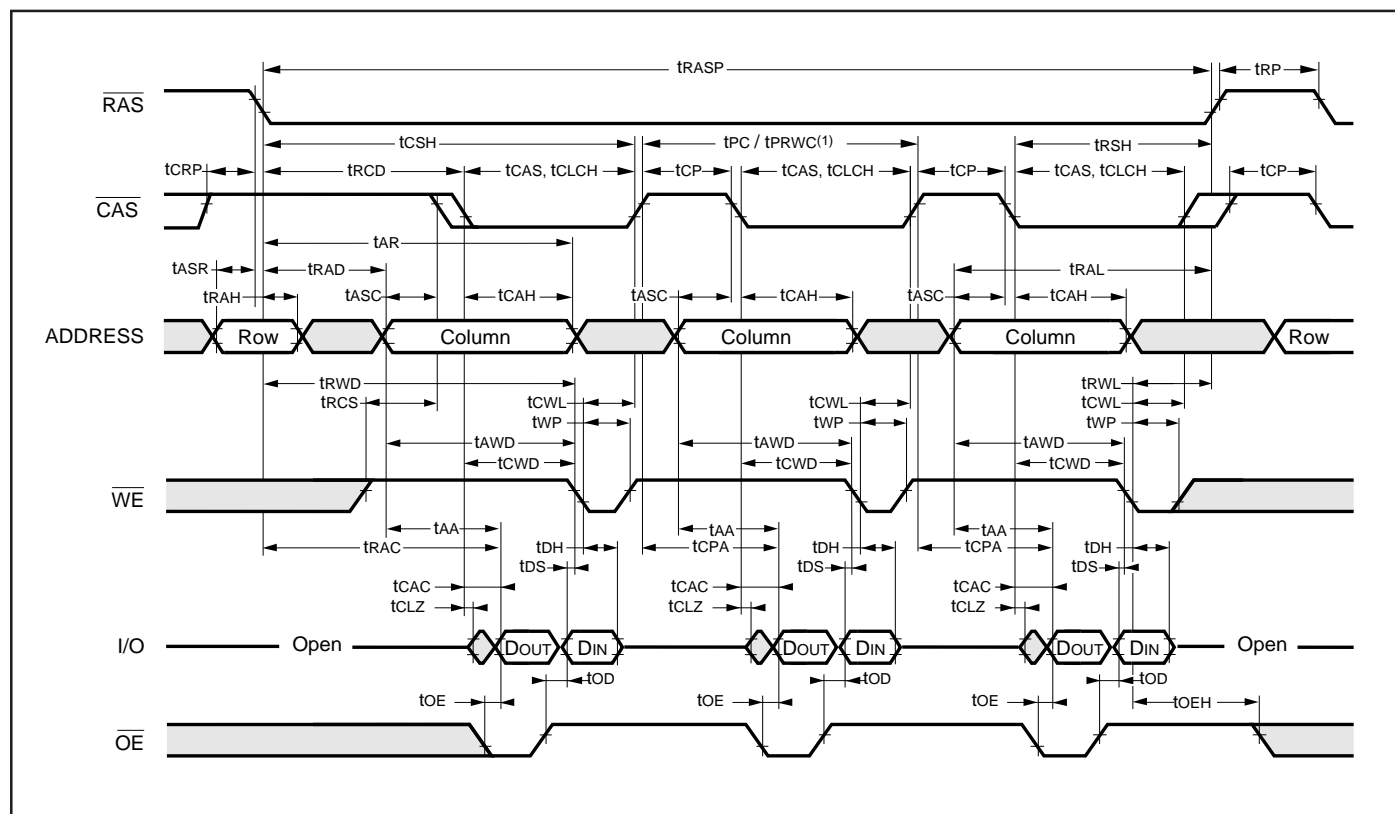

**Note:**

1.  $t_{PC}$  can be measured from falling edge of  $\overline{CAS}$  to falling edge of  $\overline{RAS}$ , or from rising edge of  $\overline{CAS}$  to rising edge of  $\overline{RAS}$ . Both measurements must meet the  $t_{PC}$  specifications.

## EDO-PAGE-MODE EARLY-WRITE CYCLE

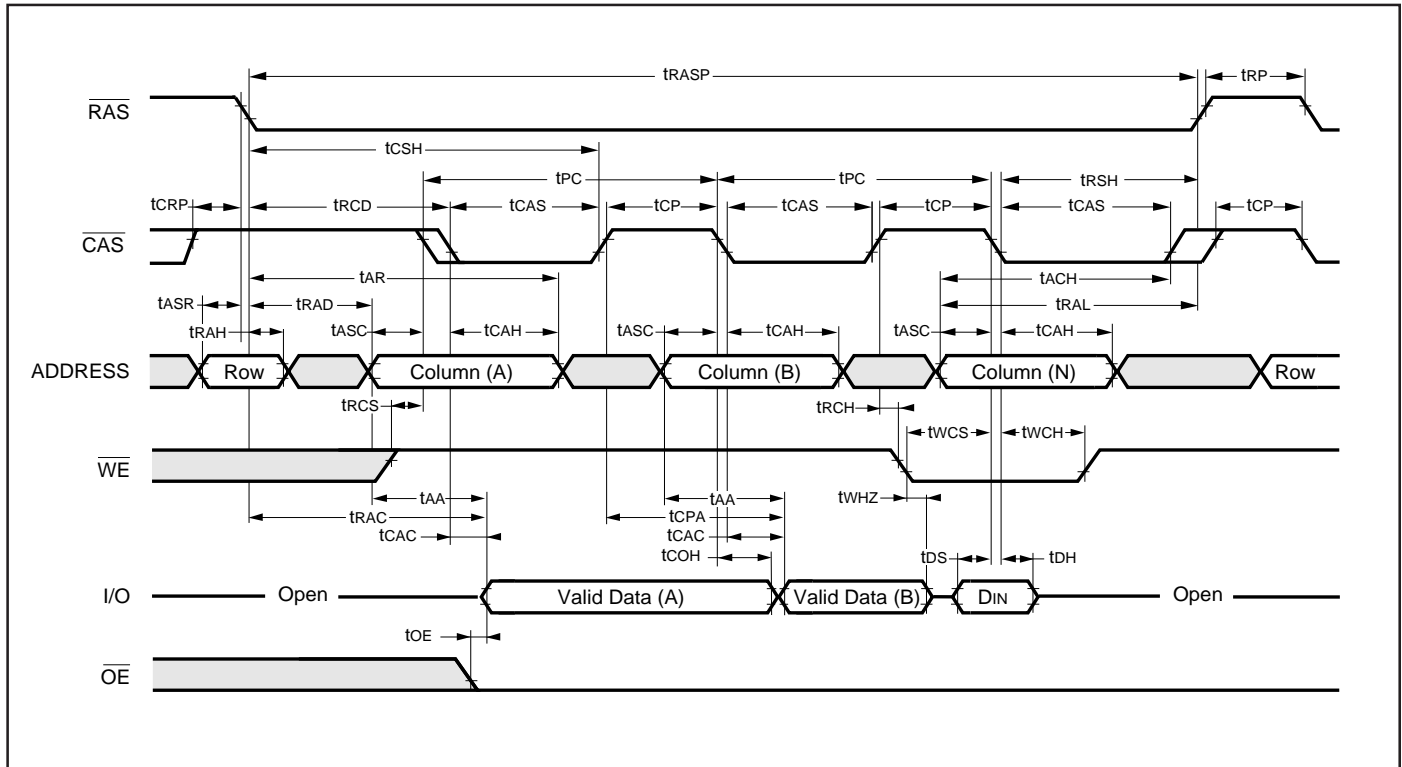

## EDO-PAGE-MODE READ-WRITE CYCLE (LATE WRITE and READ-MODIFY WRITE Cycles)

### Note:

1.  $t_{PC}$  can be measured from falling edge of  $\overline{CAS}$  to falling edge of  $\overline{CAS}$ , or from rising edge of  $\overline{CAS}$  to rising edge of  $\overline{CAS}$ . Both measurements must meet the  $t_{PC}$  specifications.

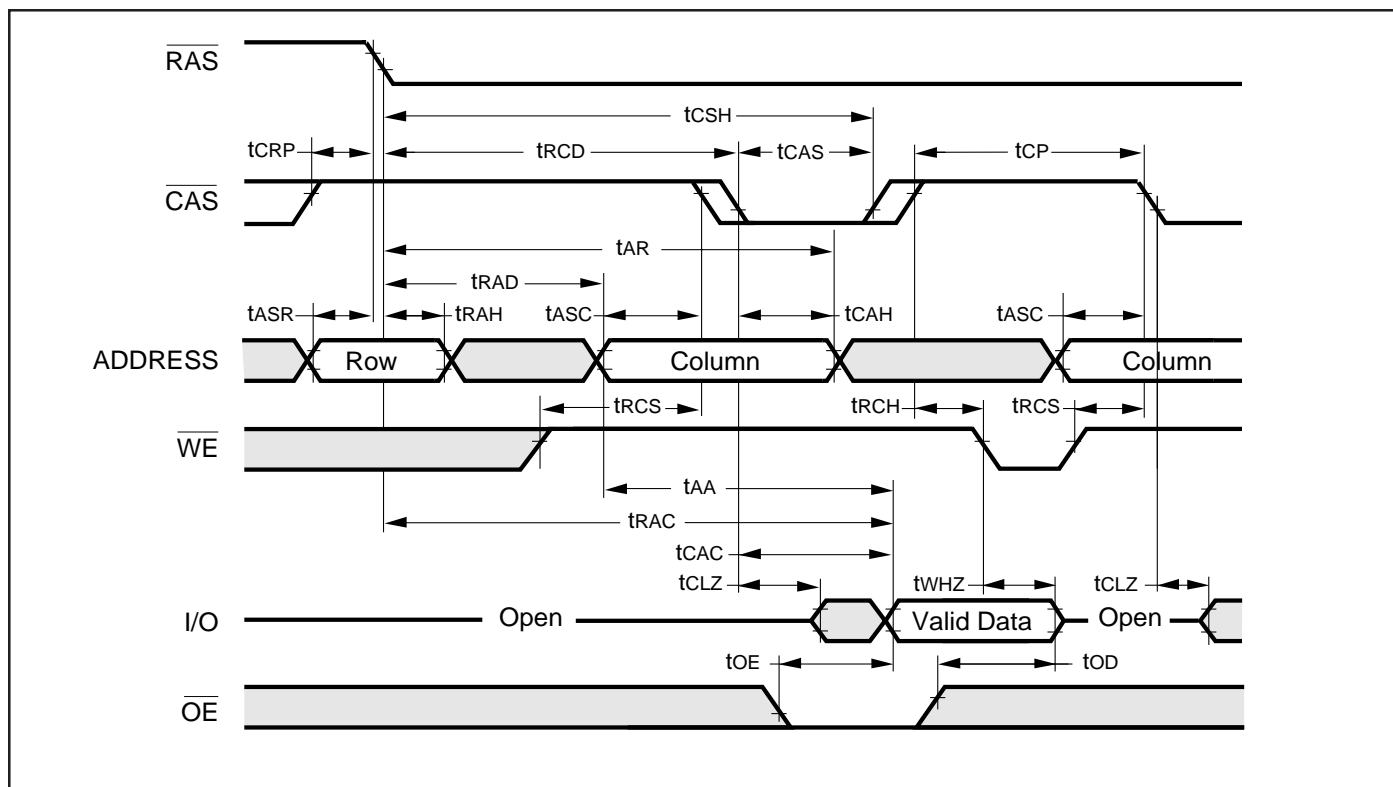

**EDO-PAGE-MODE READ-EARLY-WRITE CYCLE (Psuedo READ-MODIFY WRITE)**

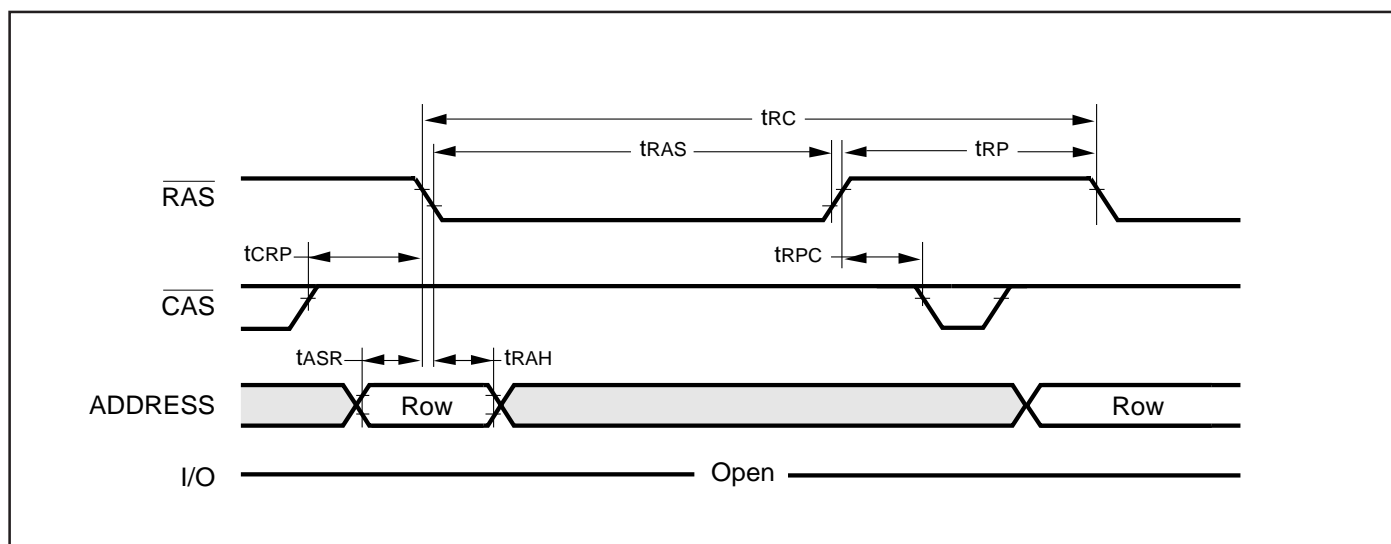

## AC WAVEFORMS

### READ CYCLE (With $\overline{WE}$ -Controlled Disable)

### $\overline{RAS}$ -ONLY REFRESH CYCLE ( $\overline{OE}$ , $\overline{WE}$ = DON'T CARE)

The diagram illustrates the timing relationships between RAS, CAS, and I/O signals. The RAS signal is shown as a series of pulses, with parameters  $t_{RP}$  (pulse width) and  $t_{RAS}$  (refresh interval) indicated. The CAS signal is also shown as a series of pulses, with parameters  $t_{RPC}$  (pulse width),  $t_{CP}$  (setup time),  $t_{CHR}$  (hold time),  $t_{CSR}$  (setup time), and  $t_{CHP}$  (hold time) indicated. The I/O signal is shown as a single pulse, with parameters  $t_{I/O}$  (pulse width) and  $t_{I/OH}$  (hold time) indicated.

The diagram illustrates the timing relationships for a 256K16 DRAM. The signals shown are  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ , ADDRESS, I/O, and  $\overline{\text{OE}}$ . The ADDRESS bus is divided into Row and Column phases. The I/O bus shows the data being read or written, transitioning from Open to Valid Data and back to Open. The  $\overline{\text{OE}}$  signal is active-low, going low during the read operation.

Key timing parameters labeled in the diagram include:

- $t_{\text{RAS}}$ : RAS access time
- $t_{\text{RP}}$ : RAS precharge time
- $t_{\text{CRP}}$ : CAS to RAS precharge time
- $t_{\text{RCD}}$ : RAS to CAS delay
- $t_{\text{RSH}}$ : RAS to RAS hold time
- $t_{\text{CHR}}$ : CAS to RAS hold time
- $t_{\text{AR}}$ : Row address strobe time
- $t_{\text{RAD}}$ : Row address delay
- $t_{\text{RAL}}$ : Row address latency
- $t_{\text{ASR}}$ : Address strobe recovery time
- $t_{\text{RAH}}$ : Row address hold time
- $t_{\text{ASC}}$ : Address strobe to column address time
- $t_{\text{CAH}}$ : Column address hold time
- $t_{\text{AA}}$ : Address to array access time
- $t_{\text{TRAC}}$ : Row to array access time
- $t_{\text{CAC}}$ : Column address to array access time
- $t_{\text{CLZ}}$ : Column latency
- $t_{\text{OE}}$ : Output enable delay
- $t_{\text{TORD}}$ : Output to RAS delay
- $t_{\text{OFF}(2)}$ : Output to RAS delay (2)
- $t_{\text{OD}}$ : Output delay

1. A Hidden Refresh may also be performed after a Write Cycle. In this case,  $\overline{\text{WE}} = \text{LOW}$  and  $\overline{\text{OE}} = \text{HIGH}$ .
2.  $\text{t}_{\text{OFF}}$  is referenced from rising edge of  $\text{RAS}$  or  $\overline{\text{CAS}}$ , whichever occurs last.

## ORDERING INFORMATION

Commercial Range: 0°C to 70°C

Voltage: 5V

Speed (ns)	Order Part No.	Refresh	Package
50	IC41C44002-50J	2K	300mil SOJ
50	IC41C44002-50T	2K	300mil TSOP-2
60	IC41C44002-60J	2K	300-mil SOJ
60	IC41C44002-60T	2K	300mil TSOP-2
