

Description

The ICS508 is the most cost effective way to generate a high quality, high frequency CMOS clock output from a PECL clock input.

The ICS508 has separate VDD supplies for the PECL input buffer and the output buffer allowing different voltages to be used. For example, the input clock could use a 3.3 V supply while the output operates from 2.5 V.

The device has an Output Enable pin that tri-states the clock output when the OE pin is taken low.

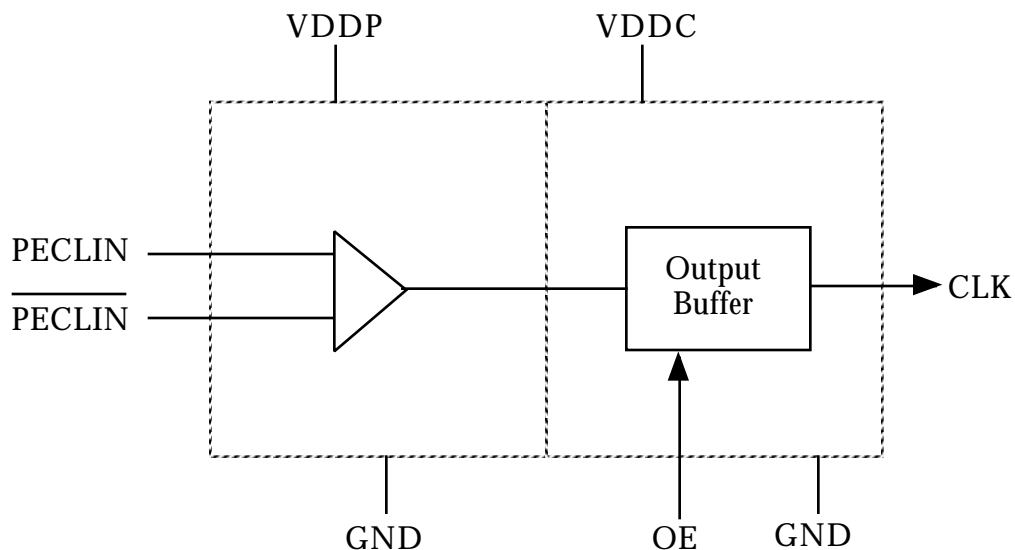

The ICS508 is a member of the ClockBlocks™ family of devices.

Features

- Packaged as 8 pin SOIC or die
- Separate VDD supplies allow voltage translation
- Clock frequency of 0 - 250 MHz
- Duty cycle of 45/55
- Operating voltages of 2.375 to 5.5 V
- Tri-state output for board level testing
- 24 mA drive capability
- Industrial temperature version available
- Advanced, low power CMOS process

**Pin Assignment****Pin Descriptions**

Number	Name	Type	Description
1	VDDP	O	Connect to 3.3 V or 5 V. Supplies PECL input buffer.
2	$\overline{\text{PECLIN}}$	I	Complementary PECL clock input.
3	PECLIN	I	PECL clock input.
4	GND	P	Connect to ground.
5	OE	I	Output enable. Tri-states CLK output when low. Internal pull-up to VDDC.
6	GND	P	Connect to ground.
7	CLK	O	Clock output.
8	VDDC	P	Connect to 2.5 V, or 3.3 V or 5 V. Supplies output buffer and OE pin.

Key: I = Input, O = output, P = power supply connection

External Components

The ICS508 requires two 0.01 μ F decoupling capacitors to be connected between VDDP and GND and between VDDC and GND. They must be connected close to the ICS508 to minimize lead inductance. A 33 Ω series terminating resistor can be used next to the CLK pin.
