

ICS601-02

Low Phase Noise Clock Multiplier

Description

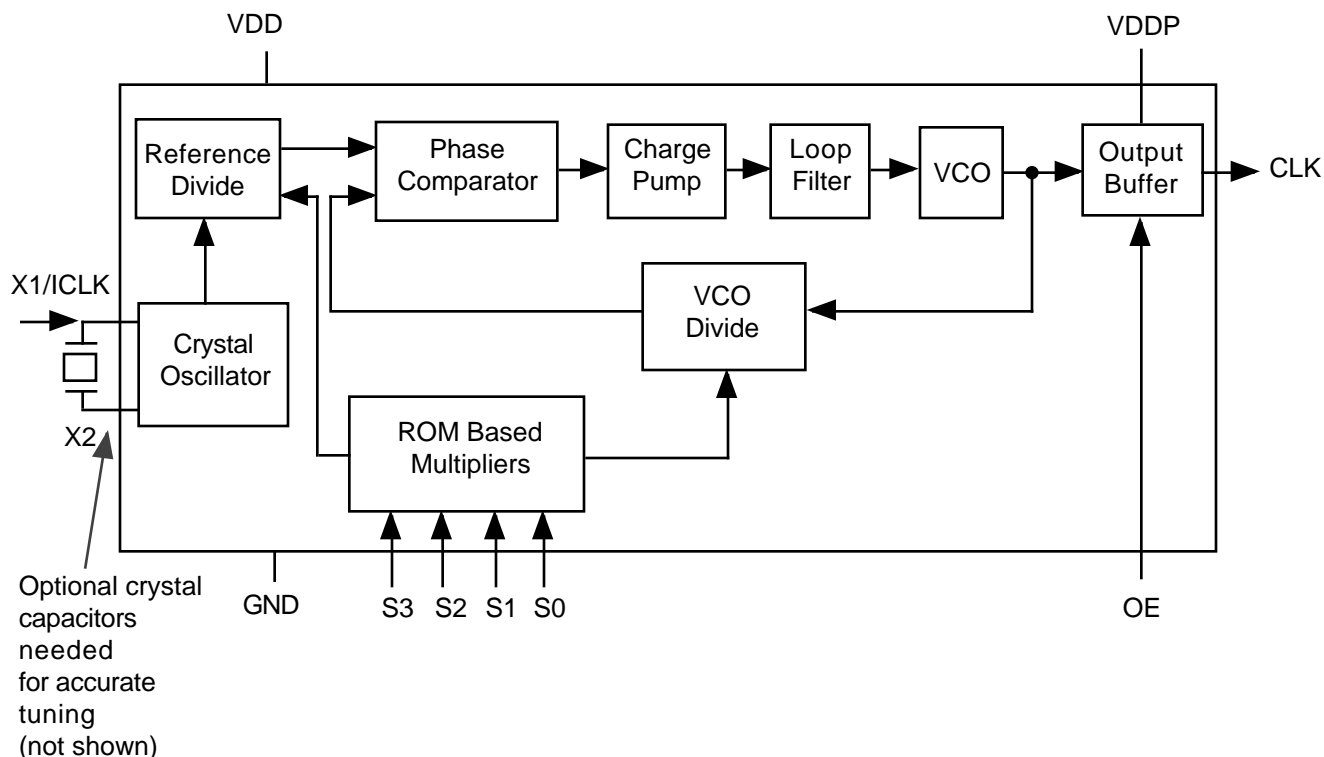

The ICS601-02 is a low cost, low phase noise, high performance clock synthesizer for any application that requires low phase noise and low jitter. The ICS601 is ICS' lowest phase noise multiplier. Using ICS' patented analog and digital Phase Locked Loop (PLL) techniques, the chip accepts a 10-27 MHz crystal or clock input, and produces output clocks up to 170 MHz at 3.3 V. A separate supply pin is provided so that the output can be 2.5 V.

This product is intended for clock generation. It has low output jitter (variation in the output period), but input to output skew and jitter are not defined nor guaranteed. For applications which require defined input to output timing, use the ICS670-01.

Features

- Packaged in 16 pin SOIC (Pb free)
- Uses fundamental 10 - 27 MHz crystal, or clock
- Patented PLL with the lowest phase noise
- Output clocks up to 170 MHz at 3.3 V
- Low phase noise: -132 dBc/Hz at 10 kHz
- Output Enable function tri states outputs
- Low jitter - 18 ps one sigma
- Full swing CMOS outputs with 25 mA drive capability at TTL levels
- Advanced, low power, sub-micron CMOS process
- Industrial temperature
- 3.3 V or 5 V core VDD. Output clock can operate down to 2.5 V

1=connect directly to VDD

Pin Descriptions

Number	Name	Type	Description
1	CLK	O	Clock output from VCO. Output frequency equals the input frequency times multiplier.
2	VDDP	P	Supply pin for CLK output buffer. Sets output clock amplitude. Connect to 2.5V or 3.3V
3	VDD	P	Connect to +3.3V or +5V. Must match other VDDs.
4	VDD	P	Connect to +3.3V or +5V. Must match other VDDs.
5	VDD	P	Connect to +3.3V or +5V. Must match other VDDs.
6	X2	XO	Crystal connection. Connect to a 10 - 27 MHz fundamental parallel mode crystal.
7	S1	I	Multiplier select pin 1. Determines CLK output per table above. Internal pull-up.
8	X1/ICLK	XI	Crystal connection. Connect to a 10-27 MHz fundamental parallel mode crystal, or clock.
9	S2	I	Multiplier select pin 2. Determines CLK output per table above. Internal pull-up.
10	S3	I	Multiplier select pin 3. Determines CLK output per table above. Internal pull-up.
11	S0	I	Multiplier select pin 0. Determines CLK output per table above. Internal pull-up.
12	OE	I	Output Enable. Tri-states the output clock when low. Internal pull-up.
13	GND	P	Connect to ground.
14	GND	P	Connect to ground.
15	GND	P	Connect to ground.
16	GND	P	Connect to ground.

Key: I = Input with internal pull-up resistor; O = output; P = power supply connection; XI, X2 = crystal connections.

Low Phase Noise Clock Multiplier

Achieving Low Phase Noise

Figure 1 shows a typical phase noise measurement in a 125 MHz system. There are a few simple steps that can be taken to achieve these levels of phase noise from the ICS601-02. Variations in VDD will increase the phase noise, so it is important to have a stable, low noise supply voltage at the device. Use decoupling capacitors of 0.1 μF in parallel with 0.01 μF . It is important to have these capacitors as close as possible to the ICS601-02 supply pins.

Disabling the REFOUT clock is also important for achieving low phase noise; lab tests have shown that this can reduce the phase noise by as much as 10 dBc/Hz.

Figure 1. Phase Noise of ICS601-02 at 125 MHz out, 25 MHz crystal input, VDD = 3.3 V.

External Components/Crystal Selection

The ICS601-02 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.01 μF and 0.1 μF should be connected between VDD and GND, as close to the part as possible. A series termination resistor of 33 Ω may be used for the clock output. The crystal must be connected as close to the chip as possible. The crystal should be fundamental mode, parallel resonant. Do not use third overtone. For exact tuning when using a crystal, capacitors should be connected from pins X1 to ground and X2 to ground. In general, the value of these capacitors is given by the following equation, where C_L is the crystal load capacitance: Crystal caps (pF) = $(C_L - 5) \times 2$. So for a crystal with 16 pF load capacitance, two 22 pF caps can be used. For any given board layout, ICS can measure the board capacitance and recommend the exact capacitance value to use.

Electrical Specifications

Parameter	Conditions	Minimum	Typical	Maximum	Units
ABSOLUTE MAXIMUM RATINGS (note 1)					
Supply voltage, VDD	Referenced to GND			7	V
Inputs and Clock Outputs	Referenced to GND	-0.5		VDD+0.5	V
Ambient Operating Temperature, I version	Industrial temperature	-40		85	°C
Soldering Temperature	Max of 10 seconds			260	°C
Storage temperature		-65		150	°C
DC CHARACTERISTICS (VDD = VDDP = 3.3 V unless noted)					
Operating Voltage, VDD		3.0		5.5	V
Output Buffer Voltage, VDDP		2.375		VDD	V
Input High Voltage, VIH, X1/ICLK pin only	Note 3	(VDD/2)+1			V
Input Low Voltage, VIL, X1/ICLK pin only	Note 3			(VDD/2)-1	V
Input High Voltage, VIH		2			V
Input Low Voltage, VIL				0.8	V
Output High Voltage, VOH, CMOS level	IOH=-4mA	VDD-0.4			V
Output High Voltage, VOH	IOH=-12mA	2.4			V
Output Low Voltage, VOL	IOL=12mA			0.4	V
Operating Supply Current, IDD	No Load, 125 MHz		9	20	mA
Short Circuit Current	Each output	±40	±60		mA
Input Capacitance	OE, select pins		5		pF
AC CHARACTERISTICS (VDD = VDDP = 3.3 V unless noted)					
Input Frequency		10		27	MHz
Output Frequency	at 3.3V or 5V			170	MHz
Output Clock Rise Time	0.8 to 2.0V, no load			1.5	ns
Output Clock Fall Time	0.8 to 2.0V, no load			1.5	ns
Output Clock Duty Cycle	At VDD/2	45	50	55	%
Maximum Absolute Jitter, short term, 125 MHz	No load		±50	±75	ps
Maximum Jitter, one sigma, 125 MHz (x5)	No load		18	25	ps
Phase Noise, relative to carrier, 125 MHz (x5)	100 Hz offset		-108		dBc/Hz
Phase Noise, relative to carrier, 125 MHz (x5)	1 kHz offset		-123		dBc/Hz
Phase Noise, relative to carrier, 125 MHz (x5)	10 kHz offset		-132		dBc/Hz
Phase Noise, relative to carrier, 125 MHz (x5)	100 kHz offset		-125		dBc/Hz

- Notes: 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
2. The phase relationship between input and output can change at power up. For a fixed phase relationship, see the ICS570 or ICS670.
3. Switching occurs nominally at VDD/2.
