

## GENERAL DESCRIPTION

The ICS85211I is a low skew, high performance 1-to-2 Differential-to-LVHSTL Fanout Buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The CLK, nCLK pair can accept most standard differential input levels. The ICS85211I is characterized to operate from a 3.3V power supply. Guaranteed output and part-to-part skew characteristics make the ICS85211I ideal for those clock distribution applications demanding well defined performance and repeatability. For optimal performance, terminate all outputs.

## FEATURES

- 2 differential LVHSTL compatible outputs
- 1 differential CLK, nCLK input pair
- CLK, nCLK pair can accept the following differential input levels: LVDS, LVPECL, LVHSTL, SSTL, HCSL
- Maximum output frequency: 700MHz
- Translates any single-ended input signal to LVHSTL levels with resistor bias on nCLK input
- Output skew: 30ps (maximum)
- Part-to-part skew: 250ps (maximum)
- Propagation delay: 1ns (maximum)
- Output duty cycle: 49% - 51% up to 266.6MHz
- $V_{OH} = 1.2V$  (maximum)
- 3.3V operating supply
- -40°C to 85°C ambient operating temperature

All parameters measured at 600MHz unless noted otherwise.

The cycle-to-cycle jitter on the input will equal the jitter on the output. The part does not add jitter.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin.

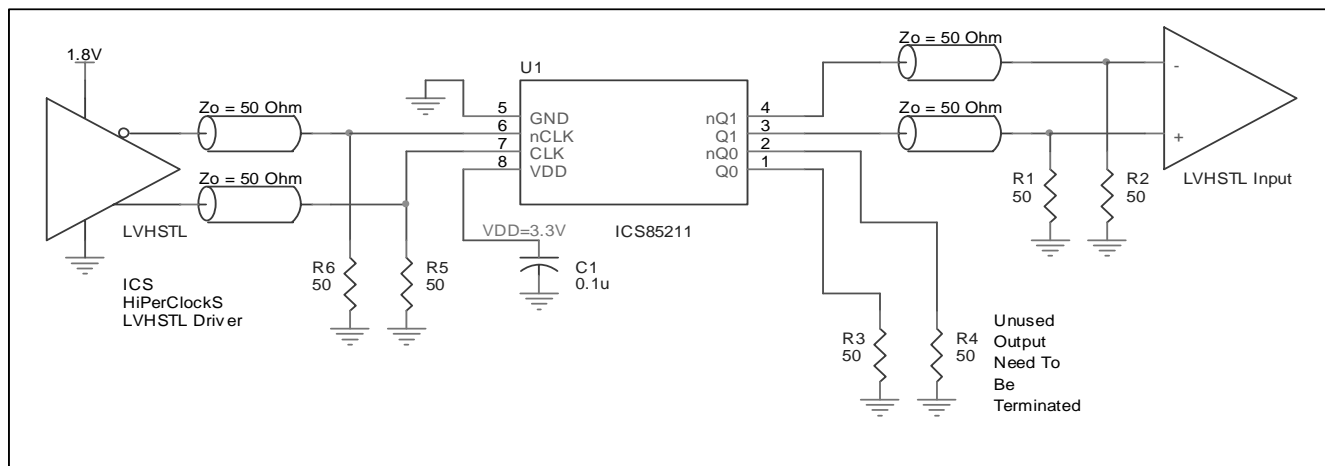

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{DD} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

### SCHEMATIC EXAMPLE

Figure 2 shows a schematic example of ICS85211I. In this example, the input is driven by an ICS HiPerClockS LVHSTL driver. The decoupling capacitors should be physically located

near the power pin. For ICS85211I, the unused outputs need to be terminated.

### CLOCK INPUT INTERFACE

The CLK /nCLK accepts differential input signals of both  $V_{\text{SWING}}$  and  $V_{\text{OH}}$  to meet the  $V_{\text{PP}}$  and  $V_{\text{CMR}}$  input requirements. *Figures 3 to 6* show interface examples for the ICS85211I clock input driven by most common driver types. The input interfaces suggested here are examples only. Please consult with the vendor of the

driver components to confirm the driver termination requirement. For example in *Figure 3*, the input termination applies for ICS HiPerClockS LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS85211I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS85211I is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{DD\_MAX} * I_{DD\_MAX} = 3.465V * 50mA = 173.3mW$
- Power (outputs)<sub>MAX</sub> = **78.88mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $2 * 78.88mW = 157.8mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 173.3mW + 157.8mW = 311.1mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 103.3°C/W per Table 6 below. Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.311W * 103.3^\circ C/W = 117.1^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 8-PIN SOIC, FORCED CONVECTION**

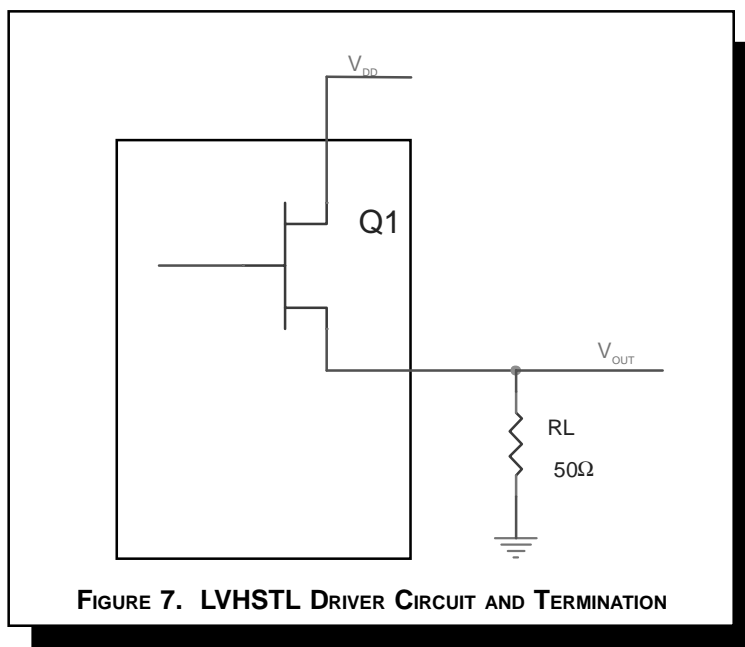

$\theta_{JA}$ by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	153.3°C/W	128.5°C/W	115.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	112.7°C/W	103.3°C/W	97.1°C/W
<b>NOTE:</b> Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.			

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVHSTL output driver circuit and termination are shown in *Figure 7*.

**FIGURE 7. LVHSTL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd\_H is power dissipation when the output drives high.

Pd\_L is the power dissipation when the output drives low.

$$Pd\_H = (V_{OH\_MAX} / R_L) * (V_{DD\_MAX} - V_{OH\_MAX})$$

$$Pd\_L = (V_{OL\_MAX} / R_L) * (V_{DD\_MAX} - V_{OL\_MAX})$$

$$Pd\_H = (1.2V / 50\Omega) * (3.465V - 1.2V) = 54.36mW$$

$$Pd\_L = (0.4V / 50\Omega) * (3.465V - 0.4V) = 24.52mW$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{78.88mW}$$
