## FAST CMOS OCTAL LATCHED TRANSCEIVER

**IDT54/74FCT543**  
**IDT54/74FCT543A**  
**IDT54/74FCT543C**

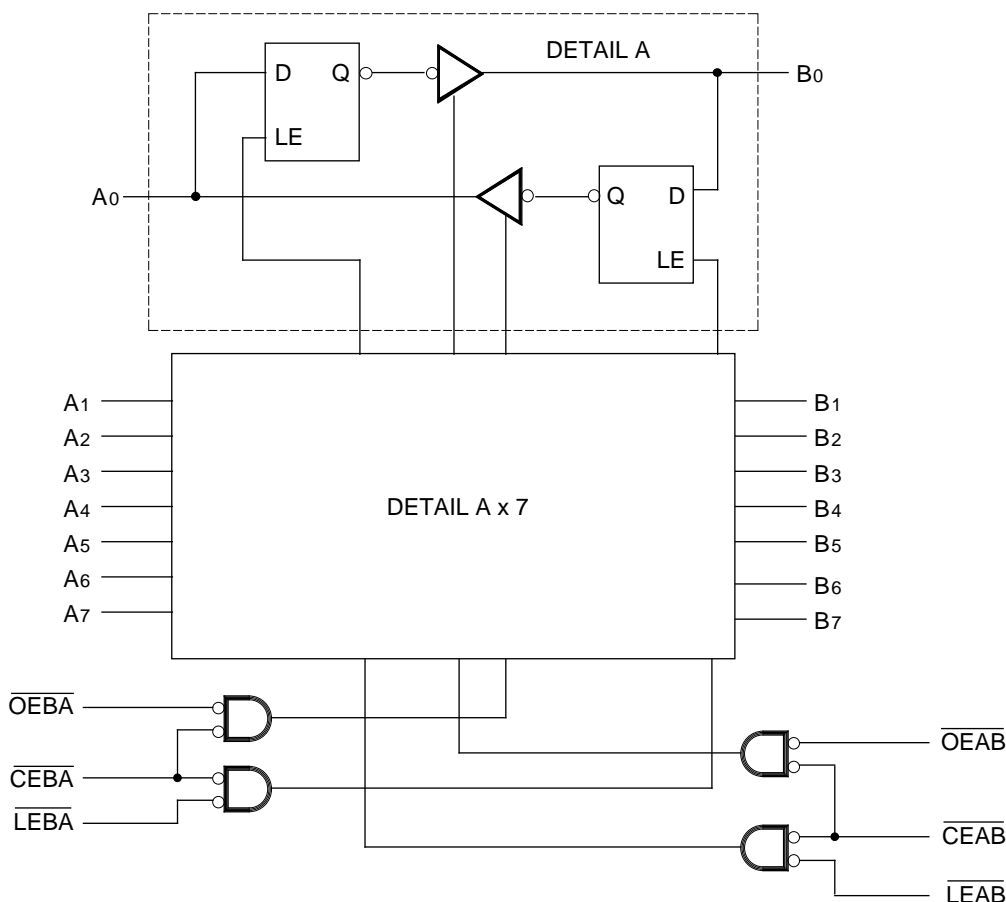

### FEATURES:

- IDT54/74FCT543 equivalent to FAST™ speed
- **IDT54/74FCT543A 25% faster than FAST**
- **IDT54/74FCT543C 40% faster than FAST**
- Equivalent to FAST output drive over full temperature and voltage supply extremes
- IOL = 64mA (commercial), 48mA (military)
- Separate controls for data flow in each direction
- Back-to-back latches for storage
- CMOS power levels (1mW typ. static)
- Substantially lower input current levels than FAST (5μA max.)
- TTL input and output level compatible
- CMOS output level compatible
- Product available in Radiation Tolerant and Radiation Enhanced versions
- Military product compliant to MIL-STD-883, Class B

### DESCRIPTION:

The IDT54/74FCT543/A/C is a non-inverting octal transceiver built using an advanced dual metal CMOS technology. These devices contain two sets of eight D-type latches with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ( $\overline{\text{CEAB}}$ ) input must be LOW in order to enter data from A0–A7 or to take data from B0–B7, as indicated in the Function Table. With  $\overline{\text{CEAB}}$  LOW, a LOW signal on the A-to-B Latch Enable ( $\overline{\text{LEAB}}$ ) input makes the A-to-B latches transparent; a subsequent LOW-to-HIGH transition of the  $\overline{\text{LEAB}}$  signal puts the A latches in the storage mode and their outputs no longer change with the A inputs. With  $\overline{\text{CEAB}}$  and  $\overline{\text{OEAB}}$  both LOW, the 3-state B output buffers are active and reflect the data present at the output of the A latches. Control of data from B to A is similar, but uses the  $\overline{\text{CEBA}}$ ,  $\overline{\text{LEBA}}$  and  $\overline{\text{OEBA}}$  inputs.

### NOTES:

2614 tbl 03

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability. No terminal voltage may exceed V<sub>CC</sub> by +0.5V unless otherwise noted.
- Inputs and V<sub>CC</sub> terminals only.
- Outputs and I/O terminals only.

### NOTES:

2614 tbl 05

- For conditions shown as Max. or Min., use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at V<sub>CC</sub> = 5.0V, +25°C ambient and maximum loading.
- Not more than one output should be shorted at one time. Duration of the short circuit test should not exceed one second.
- This parameter is guaranteed but not tested.
- These are maximum I<sub>OL</sub> values per output, for 8 outputs turned on simultaneously. Total maximum I<sub>OL</sub> (all outputs) is 512mA for commercial and 384mA for military. Derate I<sub>OL</sub> for number of outputs exceeding 8 turned on simultaneously.
