### Description

The IDT7188 is a 65,536-bit high-speed static RAM organized as 16K x 4. It is fabricated using IDT's high-performance, high-reliability technology — CMOS. This state-of-the-art technology, combined with

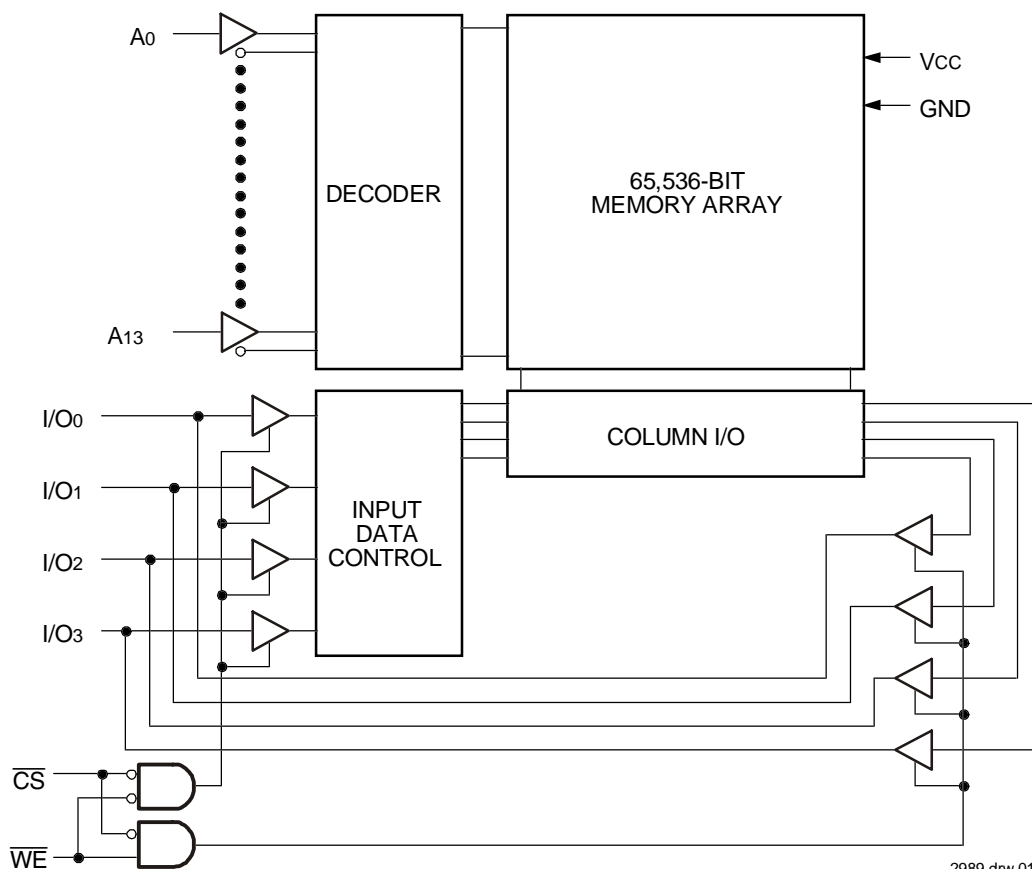

innovative circuit design techniques, provides a cost effective approach for memory intensive applications.

Access times as fast as 25ns are available. The IDT7188 offers a reduced power standby mode,  $\text{ISB}_1$ , which is activated when  $\overline{\text{CS}}$  goes HIGH. This capability significantly decreases power while enhancing system reliability. The low-power version (L) version also offers a battery backup data retention capability where the circuit typically consumes only 30 $\mu\text{W}$  operating from a 2V battery.

All inputs and outputs are TTL-compatible and operate from a single 5V supply. The IDT7188 is packaged in a 22-pin, 300 mil ceramic DIP providing excellent board-level packing densities.

Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

## Timing Waveform of Write Cycle No. 1 ( $\overline{WE}$ Controlled Timing)<sup>(1,2,3)</sup>

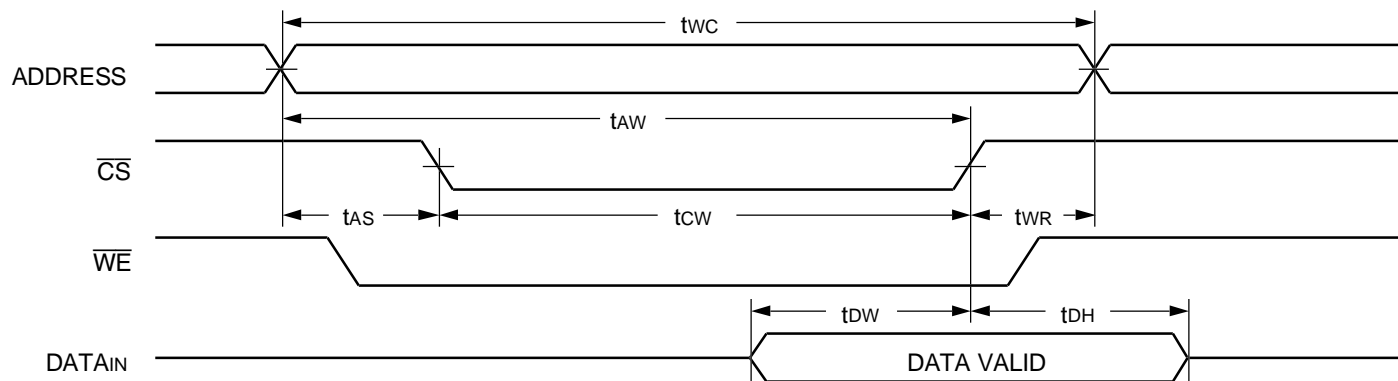

2989 drw 08

### NOTES:

1.  $\overline{WE}$  or  $\overline{CS}$  must be HIGH during all address transitions.
2. A write occurs during the overlap ( $t_{WP}$ ) of a LOW  $\overline{CS}$  and a LOW  $\overline{WE}$ .
3.  $t_{WR}$  is measured from the earlier of  $\overline{CS}$  or  $\overline{WE}$  going HIGH to the end of the write cycle.
4. During this period, I/O pins are in the output state so that the input signals should not be applied.
5. If the  $\overline{CS}$  LOW transition occurs simultaneously with or after the  $\overline{WE}$  LOW transition, the outputs remain in the high-impedance state.
6. Transition is measured  $\pm 200\text{mV}$  from steady state.

## Timing Waveform of Write Cycle No. 2 ( $\overline{\text{CS}}$ Controlled Timing)<sup>(1,2,3,5)</sup>

2989 drw 09

### NOTES:

1.  $\overline{\text{WE}}$  or  $\overline{\text{CS}}$  must be HIGH during all address transitions.
2. A write occurs during the overlap (twp) of a LOW  $\overline{\text{CS}}$  and a LOW  $\overline{\text{WE}}$ .
3. twr is measured from the earlier of  $\overline{\text{CS}}$  or  $\overline{\text{WE}}$  going HIGH to the end of the write cycle.
4. During this period, I/O pins are in the output state so that the input signals should not be applied.
5. If the  $\overline{\text{CS}}$  LOW transition occurs simultaneously with or after the  $\overline{\text{WE}}$  LOW transition, the outputs remain in the high-impedance state.
6. Transition is measured  $\pm 200\text{mV}$  from steady state.
