

PROGRAMMABLE SKEW PLL CLOCK DRIVER TURBOCLOCK™

IDT5992A

FEATURES:

- 4 pairs of programmable skew outputs
- Low skew: 200ps same pair, 250ps all outputs
- Selectable positive or negative edge synchronization:
Excellent for DSP applications
- Synchronous output enable
- Output frequency: 3.75MHz to 100MHz
- 2x, 4x, 1/2, and 1/4 outputs
- 5V with CMOS outputs
- 3 skew grades:
IDT5992A-2: $t_{SKEW0} < 250ps$
IDT5992A-5: $t_{SKEW0} < 500ps$
IDT5992A-7: $t_{SKEW0} < 750ps$
- 3-level inputs for skew and PLL range control
- PLL bypass for DC testing
- External feedback, internal loop filter
- 46mA IoL high drive outputs
- Low Jitter: <200ps peak-to-peak
- Outputs drive 50 Ω terminated lines
- Pin-compatible with Cypress CY7B992
- Available in PLCC Package

DESCRIPTION:

The IDT5992A is a high fanout PLL based clock driver intended for high performance computing and data-communications applications. A key feature of the programmable skew is the ability of outputs to lead or lag the REF input signal. The IDT5992A has eight programmable skew outputs in four banks of 2. Skew is controlled by 3-level input signals that may be hard-wired to appropriate HIGH-MID-LOW levels.

The IDT5992A maintains Cypress CY7B992 compatibility while providing two additional features: Synchronous Output Enable (GND/\overline{sOE}), and Positive/Negative Edge Synchronization (V_{DDQ}/PE). When the GND/\overline{sOE} pin is held low, all the outputs are synchronously enabled (CY7B992 compatibility). However, if GND/\overline{sOE} is held high, all the outputs except 3Q0 and 3Q1 are synchronously disabled.

Furthermore, when the V_{DDQ}/PE is held high, all the outputs are synchronized with the positive edge of the REF clock input (CY7B992 compatibility). When V_{DDQ}/PE is held low, all the outputs are synchronized with the negative edge of REF.

PIN CONFIGURATION

PLCC
TOP VIEW

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Description	Max	Unit
	Supply Voltage to Ground	-0.5 to +7	V
V _I	DC Input Voltage	-0.5 to +7	V
	Maximum Power Dissipation (T _A = 85°C)	0.8	W
T _{STG}	Storage Temperature	-65 to +150	°C

NOTE:

- Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

CAPACITANCE (T_A = +25°C, f = 1MHz, V_{IN} = 0V)

Parameter	Description	Typ.	Max.	Unit
C _{IN}	Input Capacitance	5	7	pF

NOTE:

- Capacitance applies to all inputs except TEST, FS, and nF1:0.

PIN DESCRIPTION

Pin Name	Type	Description
REF	IN	Reference Clock Input
FB	IN	Feedback Input
TEST ⁽¹⁾	IN	When MID or HIGH, disables PLL (except for conditions of Note 1). REF goes to all outputs. Skew selections (see Control Summary Table) remain in effect. Set LOW for normal operation.
GND/ $\overline{\text{sOE}}$ ⁽¹⁾	IN	Synchronous Output Enable. When HIGH, it stops clock outputs (except 3Q0 and 3Q1) in a LOW state - 3Q0 and 3Q1 may be used as the feedback signal to maintain phase lock. When TEST is held at MID level and GND/ $\overline{\text{sOE}}$ is HIGH, the nF[1:0] pins act as output disable controls for individual banks when nF[1:0] = LL. Set GND/ $\overline{\text{sOE}}$ LOW for normal operation.
VDDQ/PE	IN	Selectable positive or negative edge control. When LOW/HIGH the outputs are synchronized with the negative/positive edge of the reference clock.
nF[1:0]	IN	3-level inputs for selecting 1 of 9 skew taps or frequency functions
FS	IN	Selects appropriate oscillator circuit based on anticipated frequency range. (See PLL Programmable Skew Range.)
nQ[1:0]	OUT	Four banks of two outputs with programmable skew
VDDN	PWR	Power supply for output buffers
VDDQ	PWR	Power supply for phase locked loop and other internal circuitry
GND	PWR	Ground

NOTE:

- When TEST = MID and GND/ $\overline{\text{sOE}}$ = HIGH, PLL remains active with nF[1:0] = LL functioning as an output disable control for individual output banks. Skew selections remain in effect unless nF[1:0] = LL.

PROGRAMMABLE SKEW

Output skew with respect to the REF input is adjustable to compensate for PCB trace delays, backplane propagation delays or to accommodate requirements for special timing relationships between clocked components. Skew is selectable as a multiple of a time unit t_u which is of the order of a nanosecond (see PLL Programmable Skew Range and Resolution Table). There are nine skew configurations available for each output pair. These configurations are chosen by the nF1:0 control pins. In order

to minimize the number of control pins, 3-level inputs (HIGH-MID-LOW) are used, they are intended for but not restricted to hard-wiring. Undriven 3-level inputs default to the MID level. Where programmable skew is not a requirement, the control pins can be left open for the zero skew default setting. The Control Summary Table shows how to select specific skew taps by using the nF1:0 control pins.

EXTERNAL FEEDBACK

By providing external feedback, the IDT5992A gives users flexibility with regard to skew adjustment. The FB signal is compared with the input REF signal at the phase detector in order to drive the VCO. Phase differences cause the VCO of the PLL to adjust upwards or downwards accordingly.

An internal loop filter moderates the response of the VCO to the phase detector. The loop filter transfer function has been chosen to provide minimal jitter (or frequency variation) while still providing accurate responses to input frequency changes.

PLL PROGRAMMABLE SKEW RANGE AND RESOLUTION TABLE

	FS = LOW	FS = MID	FS = HIGH	Comments
Timing Unit Calculation (tu)	$1/(44 \times F_{NOM})$	$1/(26 \times F_{NOM})$	$1/(16 \times F_{NOM})$	
VCO Frequency Range (F_{NOM}) ^(1,2)	15 to 35MHz	25 to 60MHz	40 to 100MHz	
Skew Adjustment Range ⁽³⁾				
Max Adjustment:	$\pm 9.09ns$	$\pm 9.23ns$	$\pm 9.38ns$	ns
	$\pm 49^\circ$	$\pm 83^\circ$	$\pm 135^\circ$	Phase Degrees
	$\pm 14\%$	$\pm 23\%$	$\pm 37\%$	% of Cycle Time
Example 1, $F_{NOM} = 15MHz$	tu = 1.52ns	—	—	
Example 2, $F_{NOM} = 25MHz$	tu = 0.91ns	tu = 1.54ns	—	
Example 3, $F_{NOM} = 30MHz$	tu = 0.76ns	tu = 1.28ns	—	
Example 4, $F_{NOM} = 40MHz$	—	tu = 0.96ns	tu = 1.56ns	
Example 5, $F_{NOM} = 50MHz$	—	tu = 0.77ns	tu = 1.25ns	
Example 6, $F_{NOM} = 80MHz$	—	—	tu = 0.78ns	

NOTES:

- The device may be operated outside recommended frequency ranges without damage, but functional operation is not guaranteed. Selecting the appropriate FS value based on input frequency range allows the PLL to operate in its 'sweet spot' where jitter is lowest.
- The level to be set on FS is determined by the nominal operating frequency of the VCO and Time Unit Generator. The VCO frequency always appears at 1Q1:0, 2Q1:0, and the higher outputs when they are operated in their undivided modes. The frequency appearing at the REF and FB inputs will be the same as the VCO when the output connected to FB is undivided. The frequency of the REF and FB inputs will be 1/2 or 1/4 the VCO frequency when the part is configured for a frequency multiplication by using a divided output as the FB input.
- Skew adjustment range assumes that a zero skew output is used for feedback. If a skewed Q output is used for feedback, then adjustment range will be greater. For example if a 4tu skewed output is used for feedback, all other outputs will be skewed -4tu in addition to whatever skew value is programmed for those outputs. 'Max adjustment' range applies to output pairs 3 and 4 where $\pm 6tu$ skew adjustment is possible and at the lowest F_{NOM} value.

CONTROL SUMMARY TABLE FOR FEEDBACK SIGNALS

nF1:0	Skew (Pair #1, #2)	Skew (Pair #3)	Skew (Pair #4)
LL ⁽¹⁾	-4tu	Divide by 2	Divide by 2
LM	-3tu	-6tu	-6tu
LH	-2tu	-4tu	-4tu
ML	-1tu	-2tu	-2tu
MM	Zero Skew	Zero Skew	Zero Skew
MH	1tu	2tu	2tu
HL	2tu	4tu	4tu
HM	3tu	6tu	6tu
HH	4tu	Divide by 4	Inverted ⁽²⁾

NOTES:

- LL disables outputs if TEST = MID and $GND/\overline{sOE} = HIGH$.
- When pair #4 is set to HH (inverted), GND/\overline{sOE} disables pair #4 HIGH when $V_{DDO}/PE = HIGH$, GND/\overline{sOE} disables pair #4 LOW when $V_{DDO}/PE = LOW$.

RECOMMENDED OPERATING RANGE

Symbol	Description	IDT5992A-5,-7 (Industrial)		IDT5992A-2 (Commercial)		Unit
		Min.	Max.	Min.	Max.	
V _{DD}	Power Supply Voltage	4.5	5.5	4.75	5.25	V
T _A	Ambient Operating Temperature	-40	+85	0	+70	°C

DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE

Symbol	Parameter	Conditions	Min.	Max.	Unit
V _{IH}	Input HIGH Voltage	Guaranteed Logic HIGH (REF, FB Inputs Only)	V _{DD} −1.35	—	V
V _{IL}	Input LOW Voltage	Guaranteed Logic LOW (REF, FB Inputs Only)	—	1.35	V
V _{IHH}	Input HIGH Voltage ⁽¹⁾	3-Level Inputs Only	V _{DD} −1	—	V
V _{IMM}	Input MID Voltage ⁽¹⁾	3-Level Inputs Only	V _{DD} /2−0.5	V _{DD} /2+0.5	V
V _{ILL}	Input LOW Voltage ⁽¹⁾	3-Level Inputs Only	—	1	V
I _{IN}	Input Leakage Current (REF, FB Inputs Only)	V _{IN} = V _{DD} or GND V _{DD} = Max.	—	±5	μA
I ₃	3-Level Input DC Current (TEST, FS, nF1:0)	V _{IN} = V _{DD} HIGH Level	—	±200	μA
		V _{IN} = V _{DD} /2 MID Level	—	±50	
		V _{IN} = GND LOW Level	—	±200	
I _{PU}	Input Pull-Up Current (V _{DDO} /PE)	V _{DD} = Max., V _{IN} = GND	—	±100	μA
I _{PD}	Input Pull-Down Current (GND/sOE)	V _{DD} = Max., V _{IN} = V _{DD}	—	±100	μA
V _{OH}	Output HIGH Voltage	V _{DD} = Min., I _{OH} = −16mA	—	—	V
		V _{DD} = Min., I _{OH} = −40mA	V _{DD} −0.75	—	
V _{OL}	Output LOW Voltage	V _{DD} = Min., I _{OL} = 46mA	—	0.45	V
I _{OS}	Output Short Circuit ⁽²⁾	V _{DD} = Max., V _O = GND	—	N/A	mA

NOTES:

- These inputs are normally wired to V_{DD}, GND, or unconnected. Internal termination resistors bias unconnected inputs to V_{DD}/2. If these inputs are switched, the function and timing of the outputs may be glitched, and the PLL may require an additional lock time before all datasheet limits are achieved.
- This output is not to be shorted.

POWER SUPPLY CHARACTERISTICS

Symbol	Parameter	Test Conditions ⁽¹⁾	Typ. ⁽²⁾	Max.	Unit
I _{DDQ}	Quiescent Power Supply Current	V _{DD} = Max., TEST = MID, REF = LOW, GND/sOE = LOW, All outputs unloaded	10	40	mA
ΔI _{DD}	Power Supply Current per Input HIGH	V _{DD} = Max., V _{IN} = 3.4V	0.4	1.5	mA
I _{DDO}	Dynamic Power Supply Current per Output	V _{DD} = Max., C _L = 0pF	100	160	μA/MHz
I _{TOT}	Total Power Supply Current	V _{DD} = 5V, F _{REF} = 20MHz, C _L = 240pF ⁽¹⁾	43	—	mA
		V _{DD} = 5V, F _{REF} = 33MHz, C _L = 240pF ⁽¹⁾	63	—	
		V _{DD} = 5V, F _{REF} = 66MHz, C _L = 240pF ⁽¹⁾	117	—	

NOTE:

- For eight outputs, each loaded with 30pF.

INPUT TIMING REQUIREMENTS

Symbol	Description ⁽¹⁾	Min.	Max.	Unit
t _r , t _f	Maximum input rise and fall times, 0.8V to 2V	—	10	ns/V
t _{PWC}	Input clock pulse, HIGH or LOW	3	—	ns
D _H	Input duty cycle	10	90	%
REF	Reference Clock Input	3.75	100	MHz

NOTE:

1. Where pulse width implied by D_H is less than t_{PWC} limit, t_{PWC} limit applies.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

		Peak-to-Peak	—	—	200	—	—	200	—	—	200	

NOTES:

1. All timing and jitter tolerances apply for F_{NOM} ≥ 25MHz.
2. Skew is the time between the earliest and the latest output transition among all outputs for which the same t_U delay has been selected when all are loaded with the specified load.
3. t_{SKWPR} is the skew between a pair of outputs (xQ₀ and xQ₁) when all eight outputs are selected for 0t_U.
4. t_{SKW0} is the skew between outputs when they are selected for 0t_U.
5. For IDT5992A-2 t_{SKW0} is measured with C_L = 0pF; for C_L = 30pF, t_{SKW0} = 0.45ns Max.
6. There are 3 classes of outputs: Nominal (multiple of t_U delay), Inverted (4Q₀ and 4Q₁ only with 4F₀ = 4F₁ = HIGH), and Divided (3Q_x and 4Q_x only in Divide-by-2 or Divide-by-4 mode).
7. t_{DEV} is the output-to-output skew between any two devices operating under the same conditions (V_{DD} ambient temperature, air flow, etc.)
8. t_{LOCK} is the time that is required before synchronization is achieved. This specification is valid only after V_{DD} is stable and within normal operating limits. This parameter is measured from the application of a new signal or frequency at REF or FB until t_{PD} is within specified limits.
9. t_{PD} is measured with REF input rise and fall times (from 0.2V_{DD} to 0.8V_{DD}) of 1.5ns.
10. Measured at 0.8V_{DD}.
11. Measured at 0.2V_{DD}.

AC TEST LOADS AND WAVEFORMS

$C_L = 50\text{pF}$ ($C_L = 30\text{pF}$ for -2 and -5 devices)

Test Load

CMOS Output Waveform

CMOS Input Test Waveform

AC TIMING DIAGRAM

NOTES:

V_{DDQ}/PE : The AC Timing Diagram applies to $V_{DDQ}/PE=V_{DD}$. For $V_{DDQ}/PE=GND$, the negative edge of FB aligns with the negative edge of REF, divided outputs change on the negative edge of REF, and the positive edges of the divide-by-2 and the divide-by-4 signals align.

Skew: The time between the earliest and the latest output transition among all outputs for which the same t_u delay has been selected when all are loaded with 50pF (30pF for -2 and -5) and terminated with 50Ω to $V_{DD}/2$.

tSKEWPR: The skew between a pair of outputs (xQ0 and xQ1) when all eight outputs are selected for 0tu.

tSKEW0: The skew between outputs when they are selected for 0tu.

tDEV: The output-to-output skew between any two devices operating under the same conditions (V_{DD} , ambient temperature, air flow, etc.)

tDCV: The deviation of the output from a 50% duty cycle. Output pulse width variations are included in tSKEW2 and tSKEW4 specifications.

tpWH is measured at 0.8V_{DD}.

tpWL is measured at 0.2V_{DD}.

torise and **tofall** are measured between 0.2V_{DD} and 0.8V_{DD}.

tLOCK: The time that is required before synchronization is achieved. This specification is valid only after V_{DD} is stable and within normal operating limits. This parameter is measured from the application of a new signal or frequency at REF or FB until t_{PD} is within specified limits.
