HIGH-SPEED 4K x 9 SYNCHRONOUS DUAL-PORT RAM

IDT7099S

FEATURES:

- High-speed clock-to-data output times
 - Military: 20/25/30ns (max.)
 - Commercial: 15/20/25ns (max.)
- Low-power operation
 - IDT7099S
 - Active: 900 mW (typ.)
 - Standby: 50 mW (typ.)
- Architecture based on Dual-Port RAM cells
 - Allows full simultaneous access from both ports
 - Independent bit/byte Read and Write inputs for control functions
- Synchronous operation
 - 4ns setup to clock, 1ns hold on all control, data, and address inputs
 - Data input, address, and control registers
 - Fast 15ns clock to data out
 - 20ns cycle times, 50MHz operation
- Clock enable feature
- Guaranteed data output hold times
- Available in 68-pin PGA, 68-pin PLCC, and 80-pin TQFP
- Military product compliant to MIL-STD-883, Class B
- Industrial temperature range (–40°C to +85°C) is available, tested to military electrical specifications

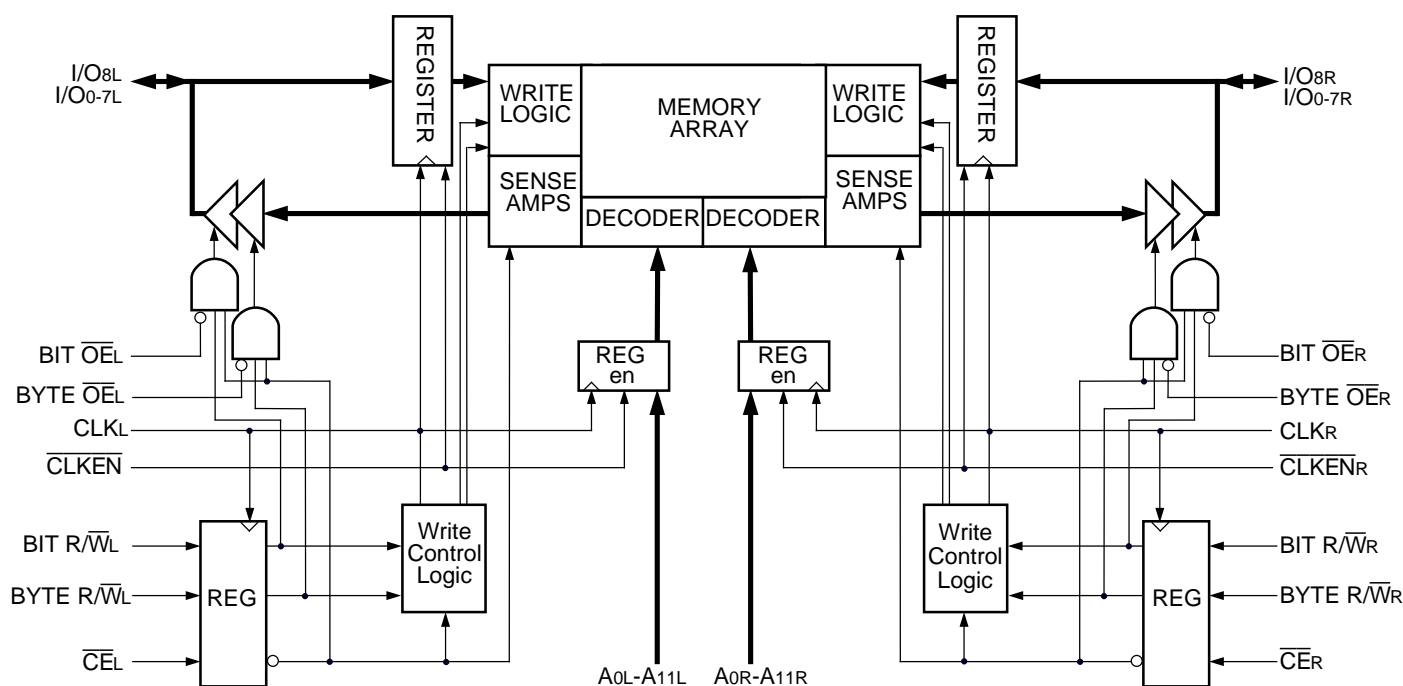

DESCRIPTION:

The IDT7099 is a high-speed 4K x 9 bit synchronous Dual-Port RAM. The memory array is based on Dual-Port memory cells to allow simultaneous access from both ports. Registers on control, data, and address inputs provide low set-up and hold times. The timing latitude provided by this approach allow systems to be designed with very short realized cycle times. With an input data register, this device has been optimized for applications having unidirectional data flow or bi-directional data flow in bursts. Changing data direction from reading to writing normally requires one dead cycle.

These Dual-Ports typically operate on only 900mW of power at maximum high-speed clock-to-data output times as fast as 15ns. An automatic power down feature, controlled by \overline{CE} , permits the on-chip circuitry of each port to enter a very low standby power mode.

The IDT7099 is packaged in a 68-pin PGA, 68-pin PLCC, and a 80-pin TQFP. Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. VTERM must not exceed Vcc + 0.5V for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of VTERM ≥ Vcc + 0.5V.

FUNCTIONAL DESCRIPTION

The IDT7099 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide very short set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal. An asynchronous output enable is provided to ease asynchronous bus interfacing.

The internal write pulse width is dependent on the low to high transitions of the clock signal allowing the shortest possible realized cycle times. Clock enable inputs are provided to stall the operation of the address and data input

registers without introducing clock skew for very fast interleaved memory applications.

The data inputs are gated to control on-chip noise in bussed applications. The user must guarantee that the BYTE R/W and BIT R/W pins are low for at least one clock cycle before any write is attempted. A High on the \overline{CE} input for one clock cycle will power down the internal circuitry to reduce static power consumption.

The device has separate Bit Write, Byte Write, Bit Enable, and Byte Enable pins to allow for independent control.
