

HIGH-SPEED 3.3V 256K x 18 SYNCHRONOUS BANK-SWITCHABLE DUAL-PORT STATIC RAM WITH 3.3V OR 2.5V INTERFACE

IDT70V7319S

Features:

- ♦ 256K x 18 Synchronous Bank-Switchable Dual-ported SRAM Architecture
 - 64 independent 4K x 18 banks
 - 4 megabits of memory on chip
- ♦ Bank access controlled via bank address pins
- ♦ High-speed data access
 - Commercial: 3.4ns (200MHz)/3.6ns (166MHz)/4.2ns (133MHz) (max.)
 - Industrial: 3.6ns (166MHz)/4.2ns (133MHz) (max.)
- ♦ Selectable Pipelined or Flow-Through output mode
- ♦ Counter enable and repeat features
- ♦ Dual chip enables allow for depth expansion without additional logic
- ♦ Full synchronous operation on both ports
 - 5ns cycle time, 200MHz operation (14Gbps bandwidth)
 - Fast 3.4ns clock to data out
 - 1.5ns setup to clock and 0.5ns hold on all control, data, and address inputs @ 200MHz
- Data input, address, byte enable and control registers
- Self-timed write allows fast cycle time
- ♦ Separate byte controls for multiplexed bus and bus matching compatibility
- ♦ LVTTTL-compatible, 3.3V ($\pm 150\text{mV}$) power supply for core
- ♦ LVTTTL compatible, selectable 3.3V ($\pm 150\text{mV}$) or 2.5V ($\pm 100\text{mV}$) power supply for I/Os and control signals on each port
- ♦ Industrial temperature range (-40°C to $+85^{\circ}\text{C}$) is available at 166MHz and 133MHz
- ♦ Available in a 144-pin Thin Quad Flatpack (TQFP), 208-pin fine pitch Ball Grid Array (fpBGA), and 256-pin Ball Grid Array (BGA)
- ♦ Supports JTAG features compliant with IEEE 1149.1
 - Due to limited pin count, JTAG is not supported on the 144-pin TQFP package.

Description:

The IDT70V7319 is a high-speed 256Kx18 (4Mbit) synchronous Bank-Switchable Dual-Ported SRAM organized into 64 independent 4Kx18 banks. The device has two independent ports with separate control, address, and I/O pins for each port, allowing each port to access any 4Kx18 memory block not already accessed by the other port. Accesses by the ports into specific banks are controlled via the bank address pins under the user's direct control.

Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times. With an input data

register, the IDT70V7319 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by CE0 and CE1, permits the on-chip circuitry of each port to enter a very low standby power mode. The dual chip enables also facilitate depth expansion.

The 70V7319 can support an operating voltage of either 3.3V or 2.5V on one or both ports, controllable by the OPT pins. The power supply for the core of the device (VDD) remains at 3.3V. Please refer also to the functional description on page 19.

5629 tbl 01

NOTES:

1. V_{DD} , OPT_x , and V_{DDOX} must be set to appropriate operating levels prior to applying inputs on the I/Os and controls for that port.
2. OPT_x selects the operating voltage levels for the I/Os and controls on that port. If OPT_x is set to V_{IH} (3.3V), then that port's I/Os and controls will operate at 3.3V levels and V_{DDOX} must be supplied at 3.3V. If OPT_x is set to V_{IL} (0V), then that port's I/Os and address controls will operate at 2.5V levels and V_{DDOX} must be supplied at 2.5V. The OPT pins are independent of one another—both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.
3. When \overline{REPEAT}_x is asserted, the counter will reset to the last valid address loaded via \overline{ADS}_x .
4. Accesses by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory with the shared array that is not currently being accessed by the opposite port (i.e., BA_{0L} - $BA_{5L} \neq BA_{0R}$ - BA_{5R}). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the ports within that bank may be corrupted (in the case that either or both ports are writing) or may result in invalid output (in the case that both ports are trying to read).

NOTES:

- "H" = V_{IH}, "L" = V_{IL}, "X" = Don't Care.
- \overline{ADS} , \overline{CNTEN} , \overline{REPEAT} are set as appropriate for address access. Refer to Truth Table II for details.
- \overline{OE} is an asynchronous input signal.
- It is possible to read or write any combination of bytes during a given access. A few representative samples have been illustrated here.

5629 tbl 03

NOTES:

- "H" = V_{IH}, "L" = V_{IL}, "X" = Don't Care.
- Read and write operations are controlled by the appropriate setting of R/ \overline{W} , \overline{CE}_0 , CE_1 , $\overline{UB}/\overline{LB}$ and \overline{OE} .
- Outputs configured in flow-through output mode: if outputs are in pipelined mode the data out will be delayed by one cycle.
- \overline{ADS} and \overline{REPEAT} are independent of all other memory control signals including \overline{CE}_0 , CE_1 and $\overline{UB}/\overline{LB}$.
- The address counter advances if \overline{CNTEN} = V_{IL} on the rising edge of CLK, regardless of all other memory control signals including \overline{CE}_0 , CE_1 , $\overline{UB}/\overline{LB}$.
- When \overline{REPEAT} is asserted, the counter will reset to the last valid address loaded via \overline{ADS} . This value is not set at power-up: a known location should be loaded via \overline{ADS} during initialization if desired. Any subsequent \overline{ADS} access during operations will update the \overline{REPEAT} address location.
- The counter includes bank address and internal address. The counter will advance across bank boundaries. For example, if the counter is in Bank 0, at address FFFh, and is advanced one location, it will move to address 0h in Bank 1. By the same token, the counter at FFFh in Bank 63 will advance to 0h in Bank 0. Refer to Timing Waveform of Counter Repeat, page 18. Care should be taken during operation to avoid having both counters point to the same bank (i.e., ensure BA_{0L} - BA_{5L} ≠ BA_{0R} - BA_{5R}), as this condition will invalidate the access for both ports. Please refer to the functional description on page 19 for details.

NOTES:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{TERM} must not exceed V_{DD} + 150mV for more than 25% of the cycle time or 4ns maximum, and is limited to ≤ 20 mA for the period of V_{TERM} \geq V_{DD} + 150mV.

NOTES:

- The Pipelined output parameters (t_{CYC2}, t_{CD2}) apply to either or both left and right ports when $\overline{FT}/PIPEX = V_{IH}$. Flow-through parameters (t_{CYC1}, t_{CD1}) apply when $\overline{FT}/PIPEX = V_{IL}$ for that port.
- All input signals are synchronous with respect to the clock except for the asynchronous Output Enable (\overline{OE}) and $\overline{FT}/PIPEX$. $\overline{FT}/PIPEX$ should be treated as a DC signal, i.e. steady state during operation.
- These values are valid for either level of V_{DDQ} (3.3V/2.5V). See page 5 for details on selecting the desired operating voltage levels for each port.
- 166MHz Industrial Temperature not available in BF-208 package.

NOTES:

1. \overline{OE} is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
2. $\overline{ADS} = V_{IL}$, \overline{CNTEN} and $\overline{REPEAT} = V_{IH}$.
3. The output is disabled (High-Impedance state) by $\overline{CE0} = V_{IH}$, $CE1 = V_{IL}$, $\overline{UB/LB} = V_{IH}$ following the next rising edge of the clock. Refer to Truth Table 1.
4. Addresses do not have to be accessed sequentially since $\overline{ADS} = V_{IL}$ constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. If $\overline{UB/LB}$ was HIGH, then the appropriate Byte of DATAOUT for $Qn + 2$ would be disabled (High-Impedance state).
6. "x" denotes Left or Right port. The diagram is with respect to that port.

2. $\overline{CE_0}$, $\overline{UB/LB}$ = V_{IL} ; CE_1 = V_{IH} .
3. The "Internal Address" is equal to the "External Address" when \overline{ADS} = V_{IL} and equals the counter output when \overline{ADS} = V_{IH} .
4. No dead cycle exists during \overline{REPEAT} operation. A READ or WRITE cycle may be coincidental with the counter \overline{REPEAT} cycle: Address loaded by last valid \overline{ADS} load will be accessed. For more information on \overline{REPEAT} function refer to Truth Table II.
5. \overline{CNTEN} = V_{IL} advances Internal Address from 'An' to 'An +1'. The transition shown indicates the time required for the counter to advance. The 'An +1' Address is written to during this cycle.
6. The counter includes bank address and internal address. The counter will advance across bank boundaries. For example, if the counter is in Bank 0, at address FFFh, and is advanced one location, it will move to address 0h in Bank 1. By the same token, the counter at FFFh in Bank 63 will advance to 0h in Bank 0.
7. For Pipelined Mode user should add 1 cycle latency for outputs as per timing waveform of read cycle for pipelined operations.

Functional Description

The IDT70V7319 is a high-speed 256Kx18 (4 Mbit) synchronous Bank-Switchable Dual-Ported SRAM organized into 64 independent 4Kx18 banks. Based on a standard SRAM core instead of a traditional true dual-port memory core, this bank-switchable device offers the benefits of increased density and lower cost-per-bit while retaining many of the features of true dual-ports. These features include simultaneous, random access to the shared array, separate clocks per port, 166 MHz operating speed, full-boundary counters, and pinouts compatible with the IDT70V3319 (256Kx18) dual-port family.

The two ports are permitted independent, simultaneous access into separate banks within the shared array. Access by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory with the shared array that is not currently being accessed by the opposite port (i.e., $BA_{0L} - BA_{5L} \neq BA_{0R} - BA_{5R}$). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the ports within that bank may be corrupted (in the case that either or both ports are writing) or may result in invalid output (in the case that both ports are trying to read).

The IDT70V7319 provides a true synchronous Dual-Port Static RAM

interface. Registered inputs provide minimal setup and hold times on address, data and all critical control inputs.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

A HIGH on \overline{CE}_0 or a LOW on CE_1 for one clock cycle will power down the internal circuitry on each port (individually controlled) to reduce static power consumption. Dual chip enables allow easier banking of multiple IDT70V7319s for depth expansion configurations. Two cycles are required with \overline{CE}_0 LOW and CE_1 HIGH to read valid data on the outputs.

Depth and Width Expansion

The IDT70V7319 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V7319 can also be used in applications requiring expanded width, as indicated in Figure 4. Through combining the control signals, the devices can be grouped as necessary to accommodate applications needing 36-bits or wider.

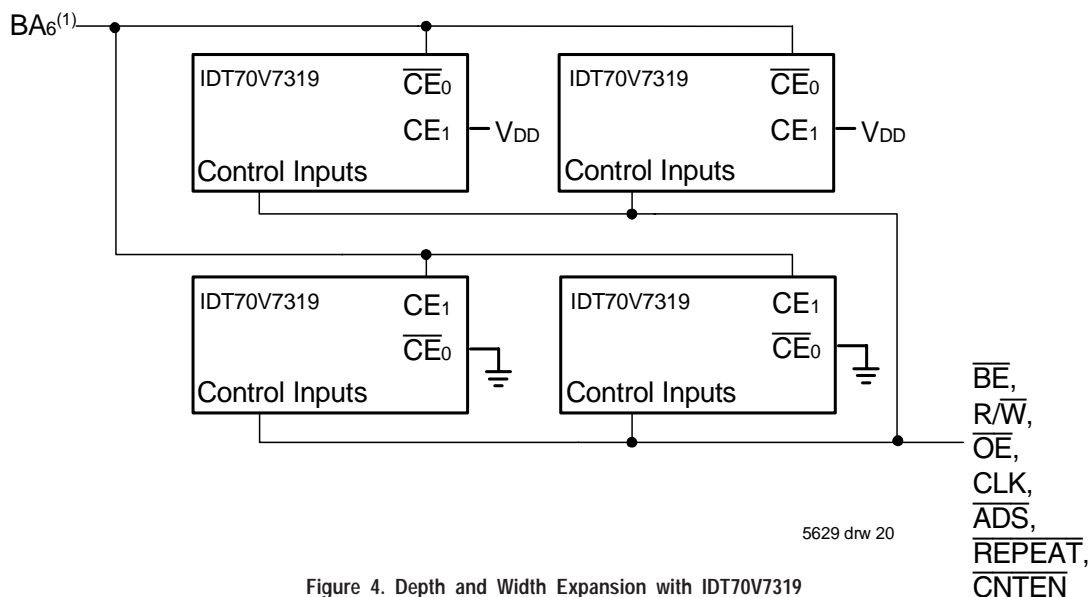

Figure 4. Depth and Width Expansion with IDT70V7319

NOTE:

1. In the case of depth expansion, the additional address pin logically serves as an extension of the bank address. Accesses by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory within the shared array that is not currently being accessed by the opposite port (i.e., $BA_{0L} - BA_{6L} \neq BA_{0R} - BA_{6R}$). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the parts within that bank may be corrupted (in the case that either or both parts are writing) or may result in invalid output (in the case that both ports are trying to read).

System Interface Parameters

Instruction	Code	Description
EXTEST	0000	Forces contents of the boundary scan cells onto the device outputs ⁽¹⁾ . Places the boundary scan register (BSR) between TDI and TDO.
BYPASS	1111	Places the bypass register (BYR) between TDI and TDO.
IDCODE	0010	Loads the ID register (IDR) with the vendor ID code and places the register between TDI and TDO.
HIGHZ	0100	Places the bypass register (BYR) between TDI and TDO. Forces all device output drivers to a High-Z state.
CLAMP	0011	Uses BYR. Forces contents of the boundary scan cells onto the device outputs. Places the bypass register (BYR) between TDI and TDO.
SAMPLE/PRELOAD	0001	Places the boundary scan register (BSR) between TDI and TDO. SAMPLE allows data from device inputs ⁽²⁾ and outputs ⁽¹⁾ to be captured in the boundary scan cells and shifted serially through TDO. PRELOAD allows data to be input serially into the boundary scan cells via the TDI.

NOTES:

1. Available in BC-256 package only.
2. Industrial Temperature at 166Mhz not available in BF-208 package.

Datasheet Document History:

1/5/00:	Initial Public Offering
6/20/01:	Page 1 Added JTAG information for TQFP package Page 4 & 22 Changed TQFP package from DA to DD Corrected Pin number on TQFP package from 100 to 110 Page 20 Increased t_{CD} from 20ns to 25ns
8/6/01:	Page 4 Changed body size for DD package from 22mm x 22mm x 1.6mm to 20mm x 20mm x 1.4mm Page 9 Changed I_{SB3} values for commercial and industrial DC Electrical Characteristics
11/20/01:	Page 2, 3 & 4 Added date revision for pin configurations Page 11 Changed t_{OE} value in AC Electrical Characteristics, please refer to Errata #SMEN-01-05 Page 1 & 22 Replaced TM logo with ® logo
3/18/02:	Page 1, 9, 11 & 22 Added 200MHz specification Page 9 Tightened power numbers in DC Electrical Characteristics Page 14 Changed waveforms to show INVALID operation if $t_{CO} <$ minimum specified Page 1 - 22 Removed "Preliminary" status
12/4/02:	Page 9, 11 & 22 Designated 200Mhz speed grade available in BC-256 package only.
