FAST CMOS PARITY BUS TRANSCEIVER

IDT54/74FCT833A
IDT54/74FCT833B

FEATURES:

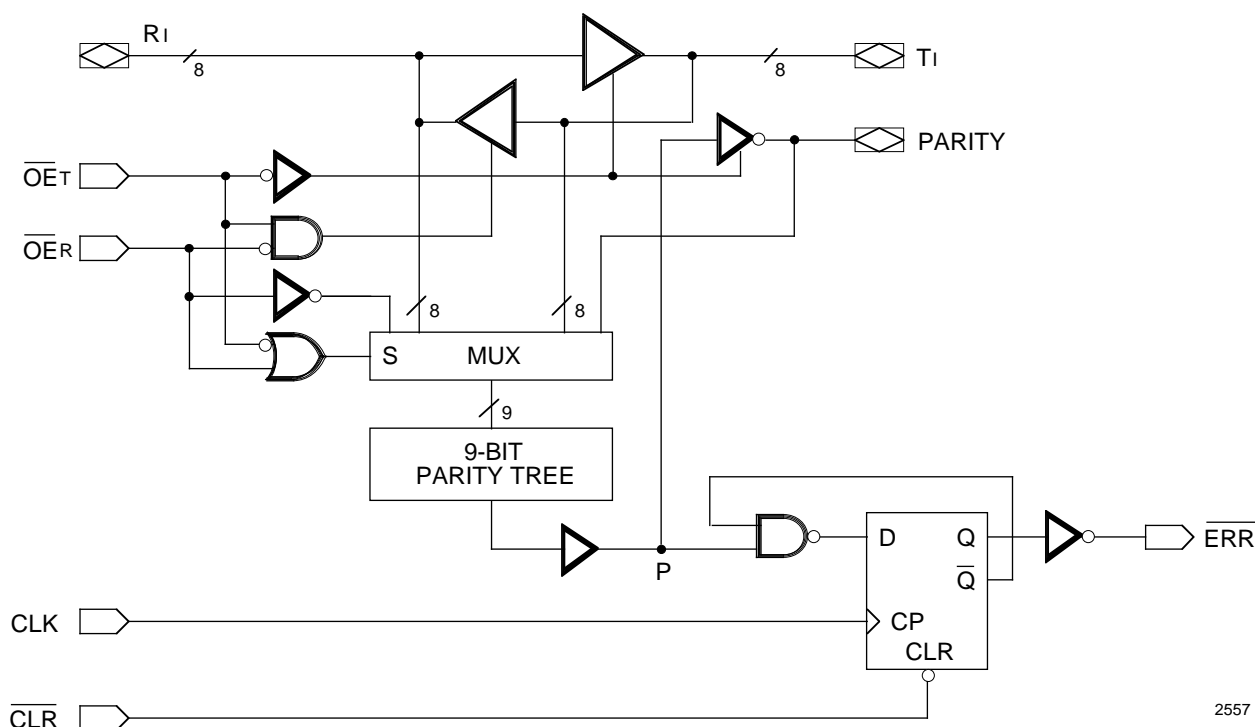

- Equivalent to AMD's Am29833 bipolar parity bus transceiver in pinout/function, speed and output drive over full temperature and voltage supply extremes
- High-speed bidirectional bus transceiver for processor-organized devices
- IDT54/74FCT833A equivalent to Am29833A speed and output drive
- **IDT54/74FCT833B 30% faster than Am29833A**
- Buffered direction and three-state controls
- Error flag with open-drain output
- IOL = 48mA (commercial) and 32mA (military)
- TTL input and output level compatible
- CMOS output level compatible
- Substantially lower input current levels than AMD's bipolar Am29800 series (5μA max.)
- Available in plastic DIP, CERDIP, LCC and SOIC
- Product available in Radiation Tolerant and Radiation Enhanced versions
- Military product compliant to MIL-STD-883, Class B

DESCRIPTION:

The IDT54/74FCT833s are high-performance bus transceivers designed for two-way communications. They each contain an 8-bit data path from the R (port) to the T (port), an 8-bit data path from the T (port) to the R (port), and a 9-bit parity checker/generator. The error flag can be clocked and stored in a register and read at the $\overline{\text{ERR}}$ output. The clear ($\overline{\text{CLR}}$) input is used to clear the error flag register.

The output enables $\overline{\text{OET}}$ and $\overline{\text{OER}}$ are used to force the port outputs to the high-impedance state so that the device can drive bus lines directly. In addition, $\overline{\text{OER}}$ and $\overline{\text{OET}}$ can be used to force a parity error by enabling both lines simultaneously. This transmission of inverted parity gives the designer more system diagnostic capability. The devices are specified at 48mA and 32mA output sink current over the commercial and military temperature ranges, respectively.

PIN CONFIGURATIONS

PIN DESCRIPTION

Pin Name	I/O	Description
OER	I	RECEIVE enable input.
Ri	I/O	8-bit RECEIVE data input/output.
ERR	O	Output from fault registers. Register detection of odd parity fault on rising clock edge (CLK). A registered ERR output remains LOW until cleared. Open drain output, requires pull up resistor.
CLR	I	Clears the fault register output.
Ti	I/O	8-bit TRANSMIT data input/output.
PARITY	I/O	1-bit PARITY output.
OET	I	TRANSMIT enable input.
CLK	I	External clock pulse input for fault register flag.

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability. No terminal voltage may exceed V_{CC} by +0.5V unless otherwise noted.
- Inputs and V_{CC} terminals.
- Outputs and I/O terminals.

- For conditions shown as Max. or Min., use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at V_{CC} = 5.0V, +25°C ambient and maximum loading.
- Not more than one output should be shorted at one time. Duration of the short circuit test should not exceed one second.
- This parameter is guaranteed but not tested.
