512K x 8 CMOS STATIC RAM MODULE

IDT7MB4048

FEATURES:

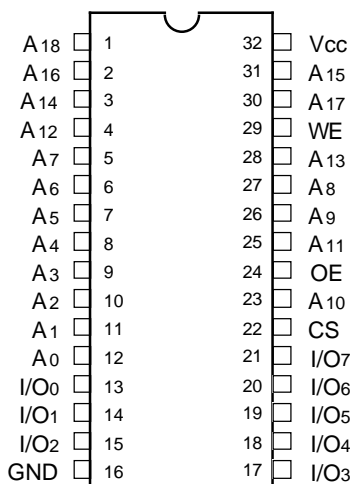

- High-density 4-megabit (512K x 8) Static RAM module
- Fast access time: 25ns (max.)
Surface mounted plastic packages on a 32-pin, 600 mil FR-4 DIP substrate
- Single 5V ($\pm 10\%$) power supply
- Inputs/outputs directly TTL-compatible

DESCRIPTION:

The IDT7MB4048 is a 4-megabit (512K x 8) Static RAM module constructed on a multilayer epoxy laminate (FR-4) substrate using four 1 megabit SRAMs and a decoder. The IDT7MB4048 is available with access times as fast as 25ns. The IDT7MB4048 is packaged in a 32-pin FR-4 DIP resulting in the JEDEC footprint in a package 1.6 inches long and 0.6 inches wide.

All inputs and outputs of the IDT7MB4048 are TTL-compatible and operate from a single 5V supply. Fully asynchronous circuitry requires no clocks or refresh for operation and provides equal access and cycle times for ease of use.

NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

TIMING WAVEFORM OF READ CYCLE NO. 1⁽¹⁾

TIMING WAVEFORM OF READ CYCLE NO. 2^(1, 2, 4)

2675 drw 07

TIMING WAVEFORM OF READ CYCLE NO. 3^(1, 3, 4)

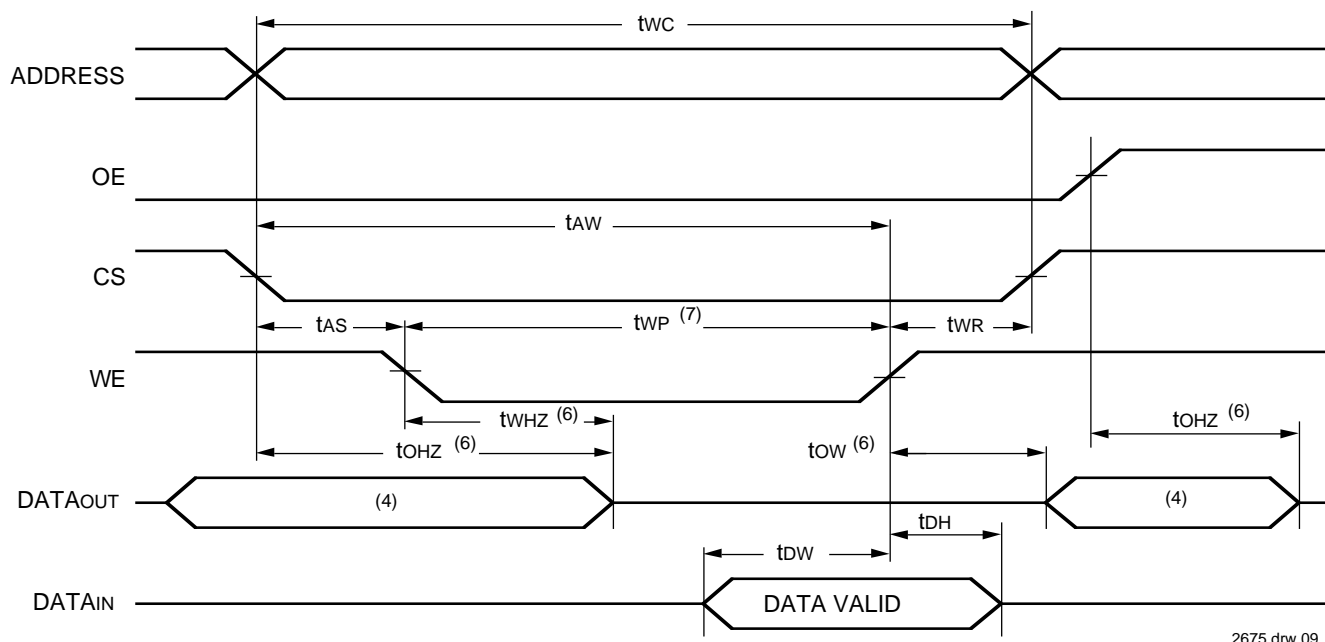

2675 drw 08

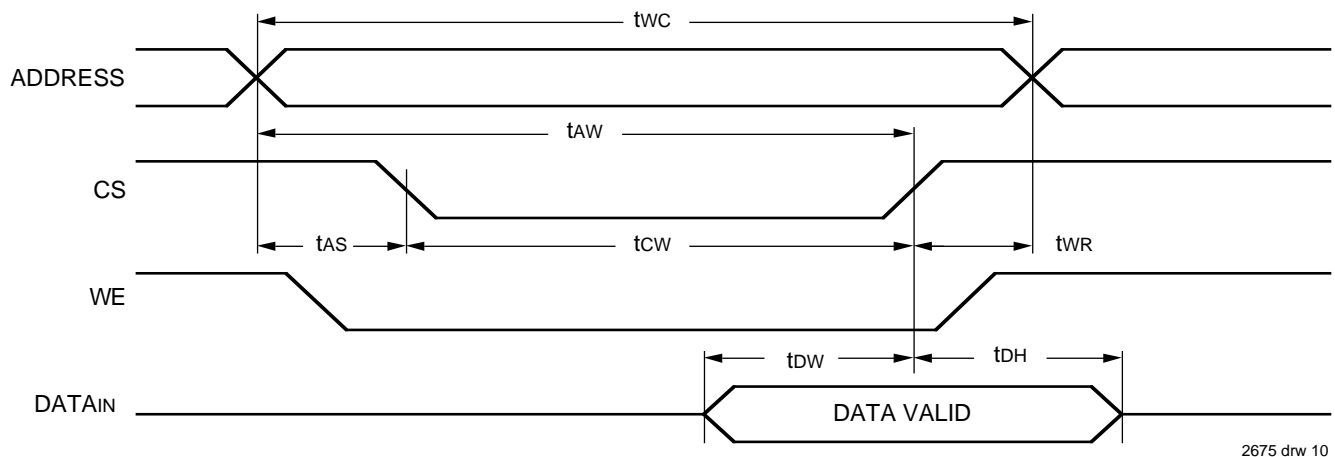

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, $\overline{CS} = V_{IL}$.
3. Address valid prior to or coincident with \overline{CS} transition LOW.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 200\text{mV}$ from steady state. This parameter is guaranteed by design, but not tested.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 (\overline{WE} CONTROLLED TIMING)^(1, 2, 3, 7)

TIMING WAVEFORM OF WRITE CYCLE NO. 2 (\overline{CS} CONTROLLED TIMING)^(1, 2, 3, 5)

NOTES:

1. \overline{WE} or \overline{CS} must be HIGH during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a LOW \overline{CS} and a LOW \overline{WE} .
3. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going HIGH to the end of write cycle.
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the \overline{CS} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
6. Transition is measured $\pm 200\text{mV}$ from steady state with a 5pF load (including scope and jig). This parameter is guaranteed by design, but not tested.
7. If \overline{OE} is LOW during a \overline{WE} controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WHZ} + t_{DW})$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .
