

Features

- High-Voltage Type (20V Rating)
- Medium Speed Operation: 8MHz (Typ.) at CL = 50pF and VDD - VSS = 10V
- Multi-Package Parallel Clocking for Synchronous High Speed Output Response or Ripple Clocking for Slow Clock Input Rise and Fall Times
- "Preset Enable" and Individual "Jam" Inputs Provided
- Binary or Decade Up/Down Counting
- BCD Outputs in Decade Mode
- 100% Tested for Maximum Quiescent Current at 20V
- 5V, 10V and 15V Parametric Ratings
- Standardized Symmetrical Output Characteristics
- Maximum Input Current of 1 μ A at 18V Over Full Package-Temperature Range; 100nA at 18V and +25°C
- Noise Margin (Over Full Package Temperature Range):
 - 1V at VDD = 5V
 - 2V at VDD = 10V
 - 2.5V at VDD = 15V
- Meets All Requirements of JEDEC Tentative Standards No. 13B, "Standard Specifications for Description of "B" Series CMOS Device's

Applications

- Programmable Binary and Decade Counting/Frequency Synthesizers-BCD Output
- Analog to Digital and Digital to Analog Conversion
- Up/Down Binary Counting
- Difference Counting
- Magnitude and Sign Generation
- Up/Down Decade Counting

Description

CD4029BMS consists of a four-stage binary or BCD-decade up/down counter with provisions for look-ahead carry in both counting modes. The inputs consist of a single CLOCK, CARRY-IN (CLOCK ENABLE), BINARY/DECADE, UP/DOWN, PRESET ENABLE, and four individual JAM signals. Q1, Q2, Q3, Q4 and a CARRY OUT signal are provided as outputs.

A high PRESET ENABLE signal allows information on the JAM INPUTS to preset the counter to any state asynchronously with the clock. A low on each JAM line, when the PRESET-ENABLE signal is high, resets the counter to its zero count. The counter is advanced one count at the positive transition of the clock when the CARRY-IN and PRE-SET ENABLE signals are low. Advancement is inhibited when the CARRY-IN or PRESET ENABLE signals are high. The CARRY-OUT signal is normally high and goes low when the counter reaches its maximum count in the UP mode or the minimum count in the DOWN mode provided the CARRY-IN signal is low. The CARRY-IN signal in the low state can thus be considered a CLOCK ENABLE. The CARRY-IN terminal must be connected to VSS when not in use.

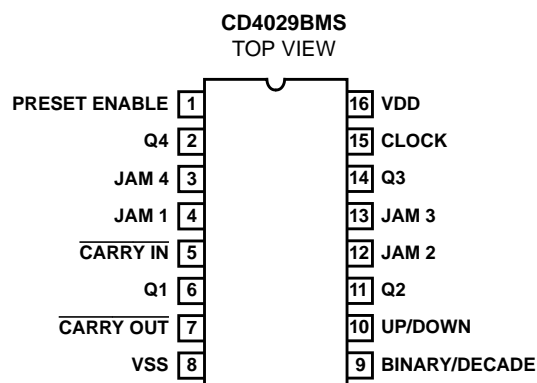

Binary counting is accomplished when the BINARY/DECADE input is high; the counter counts in the decade mode when the BINARY/DECADE input is low. The counter counts up when the UP/DOWN input is high, and down when the UP/DOWN input is low. Multiple packages can be connected in either a parallel-clocking or a ripple-clocking arrangement as shown in Figure 17.

Parallel clocking provides synchronous control and hence faster response from all counting outputs. Ripple-clocking allows for longer clock input rise and fall times.

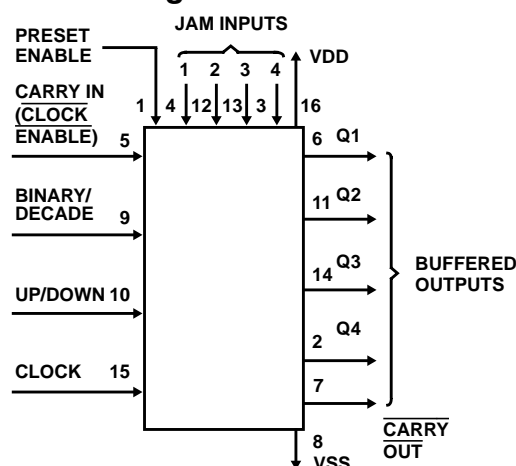

The CD4029BMS is supplied in these 16-lead outline packages:

Braze Seal DIP H4X
Frit Seal DIP H1F
Ceramic Flatpack H6W

Pinout

		VDD = 10V	1, 2, 3	+25°C	-	70	ns
		VDD = 15V	1, 2, 3	+25°C	-	50	ns
Input Capacitance	CIN	Any Input	1, 2	+25°C	-	7.5	pF

NOTES:

1. All voltages referenced to device GND.
2. The parameters listed on Table 3 are controlled via design or process and are not directly tested. These parameters are characterized on initial design release and upon design changes which would affect these characteristics.
3. CL = 50pF, RL = 200K, Input TR, TF < 20ns.
4. From Up/Down, Binary/Decode, Carry In, or Preset Enable Control Inputs to Clock Edge.
5. If more than one unit is cascaded in the parallel clocked application, tr CL should be made ≤ the sum of the fixed propagation delay at 15pF and the transition time of the carry output driving stage for the estimated capacitive load. This measurement was made with a de-coupling capacitor (>1μF) between VDD and VSS.
6. From Carry In to Clock Edge.

Timing Diagrams

The CD4029BMS CLOCK and UP/DOWN inputs are used directly in most applications. In applications where CLOCK UP and CLOCK DOWN inputs are provided, conversion to the CD4029BMS CLOCK and UP/DOWN inputs can easily be realized by use of the circuit in Figure 11.

CD4029BMS changes count on positive transitions of CLOCK UP or CLOCK DOWN inputs. For the gate configuration in Figure 12, when counting up the CLOCK DOWN input must be maintained high and conversely when counting down the CLOCK UP input must be maintained high.

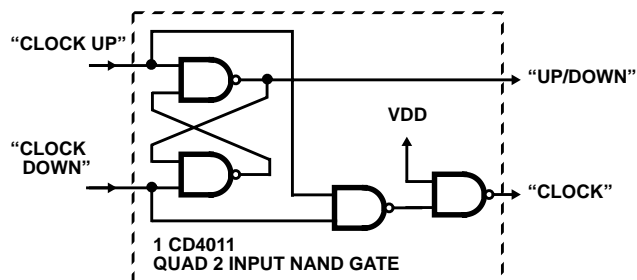

FIGURE 11. CONVERSION OF CLOCK UP, CLOCK DOWN INPUT SIGNALS TO CLOCK AND UP/DOWN INPUT SIGNALS

Timing Diagrams (Continued)

FIGURE 12. TIMING DIAGRAM-DECADE MODE

*CARRY OUT LINES AT THE 2ND, 3RD, ETC, STAGES MAY HAVE A NEGATIVE-GOING GLITCH PULSE RESULTING FROM DIFFERENTIAL DELAYS OF DIFFERENT CD4029BMS IC'S. THESE NEGATIVE GOING GLITCHES DO NOT AFFECT PROPER CD4029BMS OPERATION. HOWEVER, IF THE CARRY OUT SIGNALS ARE USED TO TRIGGER OTHER EDGE-SENSITIVE LOGIC DEVICES, SUCH AS FF'S OR COUNTERS, THE CARRY OUT SIGNALS SHOULD BE GATED WITH THE CLOCK SIGNAL USING A 2-INPUT OR GATE SUCH AS CD4071BMS.

FIGURE 13. CASCADING COUNTER PACKAGES

All Intersil semiconductor products are manufactured, assembled and tested under **ISO9000** quality systems certification.

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

For information regarding Intersil Corporation and its products, see web site <http://www.intersil.com>

“RIPPLE CLOCKING”

The diagram shows three CD4029 decade counters cascaded to form a 4-bit ripple-carry counter. The first counter is enabled by the UP/DOWN signal and the PRESET ENABLE signal. The second and third counters are enabled by the carry-out (CO) of the first counter and the PRESET ENABLE signal. The outputs of the counters are Q1, Q2, Q3, and Q4, which are connected to the BINARY/DECADE signal.

THE UP/DOWN CONTROL CAN BE CHANGED AT ANY COUNT. THE ONLY RESTRICTION ON CHANGING THE UP/DOWN CONTROL IS THAT THE CLOCK INPUT TO THE FIRST COUNTING STAGE MUST BE HIGH. FOR CASCADING COUNTERS OPERATING IN A FIXED UP-COUNT OR DOWN-COUNT MODE, THE OR GATES ARE NOT REQUIRED BETWEEN STAGES, AND \overline{CO} IS CONNECTED DIRECTLY TO THE CL INPUT OF THE NEXT STAGE WITH \overline{CI} GROUNDED.

FIGURE 13. CASCADING COUNTER PACKAGES (Continued)

Figure 1 shows a detailed circuit board layout. The board is rectangular with a black background and white traces. Components are numbered 1 through 15. Component 14 is at the top left, 13 is at the top center, 12 is at the top right, 11 is at the top right, 10 is at the top right, 9 is at the top right, 8 is at the top right, 7 is at the bottom right, 6 is at the bottom right, 5 is at the bottom right, 4 is at the bottom right, 3 is at the bottom right, 2 is at the bottom left, 15 is at the middle left, and 16 is at the middle left. There are also two '+' symbols on the board. Dimensions are indicated: 4-10 (0.102-0.250) for a small section, 105-113 (2.667-2.870) for the main width, and 84-92 (2.134-2.336) for the main height.

DIE THICKNESS: 0.0198 inches - 0.0218 inches
