

Monolithic, Quad SPST, CMOS Analog Switches

The DG444 and DG445 monolithic CMOS analog switches are drop-in replacements for the popular DG211 and DG212 series devices. They include four independent single pole single throw (SPST) analog switches and TTL and CMOS compatible digital inputs.

These switches feature lower analog ON resistance ($<85\Omega$) and faster switch time ($t_{ON} < 250\text{ns}$) compared to the DG211 and DG212. Charge injection has been reduced, simplifying sample and hold applications.

The improvements in the DG444 series are made possible by using a high voltage silicon-gate process. An epitaxial layer prevents the latch-up associated with older CMOS technologies. The 44V maximum voltage range permits controlling $\pm 20\text{V}$ signals when operating with $\pm 20\text{V}$ power supplies.

The four switches are bilateral, equally matched for AC or bidirectional signals. The ON resistance variation with analog signals is quite low over a $\pm 5\text{V}$ analog input range. The switches in the DG444 and DG445 are identical, differing only in the polarity of the selection logic.

Features

- ON Resistance (Max) 85Ω
- Low Power Consumption (P_D) $<35\mu\text{W}$
- Fast Switching Action
 - t_{ON} (Max) 250ns
 - t_{OFF} (Max, DG444) 140ns
- Low Charge Injection
- Upgrade from DG211/DG212
- TTL, CMOS Compatible
- Single or Split Supply Operation

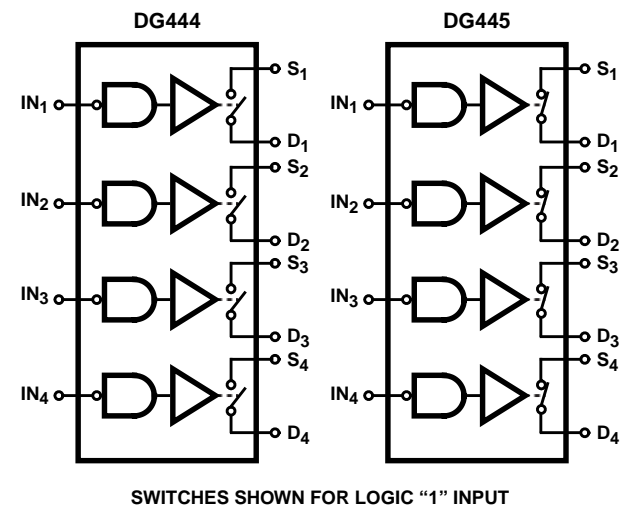

Applications

- Audio Switching
- Battery Operated Systems
- Data Acquisition
- Hi-Rel Systems
- Sample and Hold Circuits
- Communication Systems
- Automatic Test Equipment

 SOIC Package 115
 Maximum Junction Temperature (Plastic Packages) 150°C
 Maximum Storage Temperature Range -65°C to 150°C
 Maximum Lead Temperature (Soldering 10s) 300°C (SOIC - Lead Tips Only)

Operating Conditions

Temperature Range -40°C to 85°C
 Voltage Range $\pm 20V$ (Max)
 Temperature Range -55°C to 125°C
 Input Low Voltage 0.8V (Max)
 Input High Voltage 2.4V (Min)
 Input Rise and Fall Time $\leq 20ns$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. Signals on S_X, D_X, or IN_X exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
2. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

NOTES:

- V_{IN} = input voltage to perform proper function.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.

Test Circuits and Waveforms

V_O is the steady state output with the switch on. Feedthrough via switch capacitance may result in spikes at the leading and trailing edge of the output waveform.

NOTE: Logic input waveform is inverted for switches that have the opposite logic sense.
