

85MHz Current Feedback Amplifier

élantec

The EL2130 is a wideband current mode feedback amplifier optimized for gains between -10 and +10 while

operating on $\pm 5V$ power supplies. Built using Elantec's Complementary Bipolar process, this device exhibits -3dB bandwidths in excess of 85MHz at unity gain and 75MHz at a gain of two. The EL2130 is capable of output currents in excess of 50mA giving it the ability to drive either double or single terminated 50 Ω coaxial cables.

Exhibiting a Differential Gain of 0.03% and a Differential Phase of 0.1° at NTSC and PAL frequencies, the EL2130 is an excellent low cost solution to most video applications.

In addition, the EL2130 exhibits very low gain peaking, typically below 0.1dB to frequencies in excess of 40MHz as well as 50ns settling time to 0.2% making it an excellent choice for driving flash A/D converters.

The device is available in the plastic 8-pin narrow-body small outline (SO) and the 8-pin mini DIP packages, and operates over the temperature range of 0°C to +75°C

Manufactured under U.S. Patent No. 4,893,091.

Features

- -3dB bandwidth = 85MHz, $A_V = 1$
- -3dB bandwidth = 75MHz, $A_V = 2$
- NTSC/PAL dG $\leq 0.03\%$, dP $\leq 0.1^\circ$
- 50mA output current
- Drives $\pm 2.5V$ into 100 Ω load
- Low voltage noise = 4nV \sqrt{Hz}
- Current mode feedback
- Low cost

Applications

- Video amplifier
- Video distribution amplifier
- Residue amplifiers in ADC
- Current to voltage converter
- Coaxial cable driver

Applications Information

Power Supply Bypassing

The EL2130 will exhibit ringing or oscillation if the power supply leads are not adequately bypassed. 0.1 μ F ceramic disc capacitors are suggested for both supply pins at a distance no greater than 1/2 inch from the device. Surface mounting chip capacitors are strongly recommended.

Lead Dress

A ground plane to which decoupling capacitors and gain setting resistors are terminated will eliminate overshoot and ringing. However, the ground plane should not extend to the vicinity of both the non-inverting and inverting inputs (pins 3 and 2) which would add capacitance to these nodes, and lead lengths from these pins should be made as short as possible.

Use of sockets, particularly for the SO package, should be avoided if possible. Sockets add parasitic inductance and capacitance which will result in peaking and overshoot.

Video Characteristics and Applications

Frequency domain testing is performed at Elantec using a computer controlled HP model 8656B Signal Generator and an HP Model 4195A Network/Spectrum Analyzer. The DUT test board is built using microwave/strip line techniques, and solid coaxial cables route the stimulus to the DUT socket. Signals are routed to and from the DUT test fixture using subminiature coaxial cable.

Differential Gain and Phase are tested at a noise gain of 2 with 100 Ω load. Gain and Phase measurements are made with a DC input reference voltage at 0V and compared to those made at V_{REF} equal to 0.7V at frequencies extending to 30MHz.

The EL2130 is capable of driving 100 Ω to a minimum of 2.5V peak which means that it can naturally drive double terminated (50 Ω) coaxial cables.

Capacitive Loads

As can be seen from the Bode plot, the EL2130 will peak into capacitive loads greater than 20pF. In many applications such as flash A/Ds, capacitive loading is unavoidable. In these cases, the use of a snubber network consisting of a 100 Ω resistor in series with 47pF capacitor from the output to ground is recommended.
