

Triple 2:1 300MHz Mux-Amp $A_V = 2$

The EL4332 is a triple very high speed 2:1 Multiplexer-Amplifier. It is intended primarily for component video multiplexing and is especially suited for pixel switching. The amplifiers have their gain set to 2 internally, which reduces the need for many external components. The gain-of-2 facilitates driving back terminated cables. All three amplifiers are switched simultaneously from their A to B inputs by the TTL/CMOS compatible, common A/B control pin.

A -3dB bandwidth of 300MHz together with 3ns multiplexing time enable the full performance of the fastest component video systems to be realized.

The EL4332 runs from standard $\pm 5V$ supplies, and is available in the narrow 16-pin small outline package.

Pinout

EL4332
[16-PIN SO (0.150")]
TOP VIEW

Features

- 3ns A-B switching
- 300MHz bandwidth
- Fixed gain of 2, for cable driving
- > 650V/ μ s slew rate
- TTL/CMOS compatible switch
- Pb-free available

Applications

- RGB multiplexing
- Picture-in-picture
- Cable driving
- HDTV processing
- Switched gain amplifiers
- ADC input multiplexer

Ordering Information

PART NUMBER	PACKAGE	TAPE & REEL	PKG. DWG. #
EL4332CS	16-Pin SO (0.150")	-	MDP0027

EL4332CS-T13	16-Pin SO (0.150")	13"	MDP0027
EL4332CSZ (Note)	16-Pin SO (0.150") (Pb-Free)	-	MDP0027
EL4332CSZ-T7 (Note)	16-Pin SO (0.150") (Pb-Free)	7"	MDP0027
EL4332CSZ-T13 (Note)	16-Pin SO (0.150") (Pb-Free)	13"	MDP0027

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which is compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J Std-020B.

Demo Board

A demo PCB is available for this product.

Absolute Maximum Ratings ($T_A = 25^\circ\text{C}$)

V_{CC} to V_{EE} 14V
 V_{CC} to any GND12V
 V_{EE} to any GND12V
 Continuous Output Current 45mA
 Any Input $V_{EE} - 0.3\text{V}$ to $V_{CC} + 0.3\text{V}$

Input Current, Any Input. 5mA
 Power Dissipation See Curves
 Ambient Operating Temperature -40°C to 85°C
 Junction Temperature 150°C
 Storage Temperature. -60°C to $+150^\circ\text{C}$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

DC Electrical Specifications $V_{CC} = +5\text{V}$, $V_{EE} = -5\text{V}$, Temperature = 25°C , $R_L = \infty$

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNITS
V_{OS}	Input Referred Offset Voltage		8	20	mV

Pin Descriptions

PIN NAME	FUNCTION
A1, A2, A3	"A" inputs to amplifiers 1, 2 and 3 respectively.
B1, B2, B3	"B" inputs to amplifiers 1, 2 and 3 respectively.
GND1, GND2, GND3	These are the individual ground pins for each channel.
Out1, Out2, Out3	Amplifier outputs. Note: there is no short circuit protection on any output.
V_{CC}	Positive power supply. Typically +5V.
V_{EE}	Negative power supply. Typically -5V.
A/B	Common input select pin, a logic high selects the "A" inputs, logic low selects the "B" inputs. CMOS/TTL compatible.

Applications Information

Figure 26 shows a typical use for the EL4332. The circuit is a component video (R,G, B or Y,U,V) multiplexer. Since the gain of the internal amplifiers has been set to 2, the only extra components needed are the supply decoupling capacitors and the back terminating resistors, if transmission lines are to be driven. The EL4332 can drive backmatched 50Ω or 75Ω loads.

Grounds

It will be noticed that each mux-amp channel has its own separate ground pin. These ground pins have been kept separate to keep the channel separation inside the chip as large as possible. The feedback resistors use these ground pins as their reference. The resistors total 400Ω, so there is a significant signal current flowing from these pins to ground.

The ground pins should all be connected together, to a ground plane underneath the chip. 1 oz. copper for the ground plane is highly recommended.

Further notes and recommended practices for high speed printed circuit board layout can be found in the tutorials in the Elantec databooks.

Supplies

Supply bypassing should be as physically near the power pins as possible. Chip capacitors should be used to minimize lead inductance. Note that larger values of capacitor tend to have larger internal inductances. So when designing for 3 transmission lines or similar moderate loads, a 0.1μF ceramic capacitor right next to the power pin in parallel with a 22μF tantalum capacitor placed as close to the 0.1μF is recommended. For lighter loadings, or if not all the channels are being used, a single 4.7μF capacitor has been found quite adequate.

Note that component video signals do tend to have a high level of signal correlation. This is especially true if the video signal has been derived from 3 synchronously clocked DACs. This corresponds to all three channels drawing large slew currents simultaneously from the supplies. Thus, proper bypassing is critical.

Logic Inputs

The A/B select, logic input, is internally referenced to ground. It is set at 2 diode drops above ground, to give a threshold of about 1.4V (see Figure 27). The PNP input transistor requires that the driving gate be able to sink current, typically $< 30\mu\text{A}$, for a logic “low”. If left to float, it will be a logic “high”.

FIGURE 27. SIMPLIFIED LOGIC INPUT STAGE

The input PNP transistors have sufficient gain that a simple level shift circuit (see Figure 28) can be used to provide a simple interface with Emitter Coupled Logic. Typically, 200mV is enough to switch from a solid logic “low” to a “high.”

FIGURE 28. ADAPTING THE SELECT PIN FOR ECL LOGIC LEVELS

The capacitor C_{FF} is only in the network to prevent the A/B pin's capacitance from slowing the control signal. The network shown level shifts the ECL levels, -0.7V to -1.5V to +1.6V and +1.1V respectively. The terminating resistor, R_{TT} , is required since the open emitter of the ECL gate can not sink current. If a -2V rail is not being used, a 220Ω to 330Ω resistor to the -5.2V rail would have the same effect.

Expanding the Multiplexer

In Figure 29, a 3:1 multiplexer circuit is shown. The expansion to more inputs is very straight forward. Since the EL4332 has a fixed gain of 2, interstage attenuators may be required as shown in Figure 28. The truth table for the 3:1 multiplexer select lines is:

TABLE 1.

X	Y	MUX OUTPUT
0	0	R3, G3, B3
0	1	R2, G2, B2
1	X	R1, G1, B1

When interstage attenuators are used, the values should be kept down in the region of 50Ω – 300Ω . This is to prevent a combination of circuit board stray capacitance and the EL4332's input capacitance forming a significant pole. For example, if instead of 100Ω as shown, resistors of $1k\Omega$ had been used, and assuming $3pF$ of stray and $3pF$ of input capacitance, a pole would be formed at about $53MHz$.

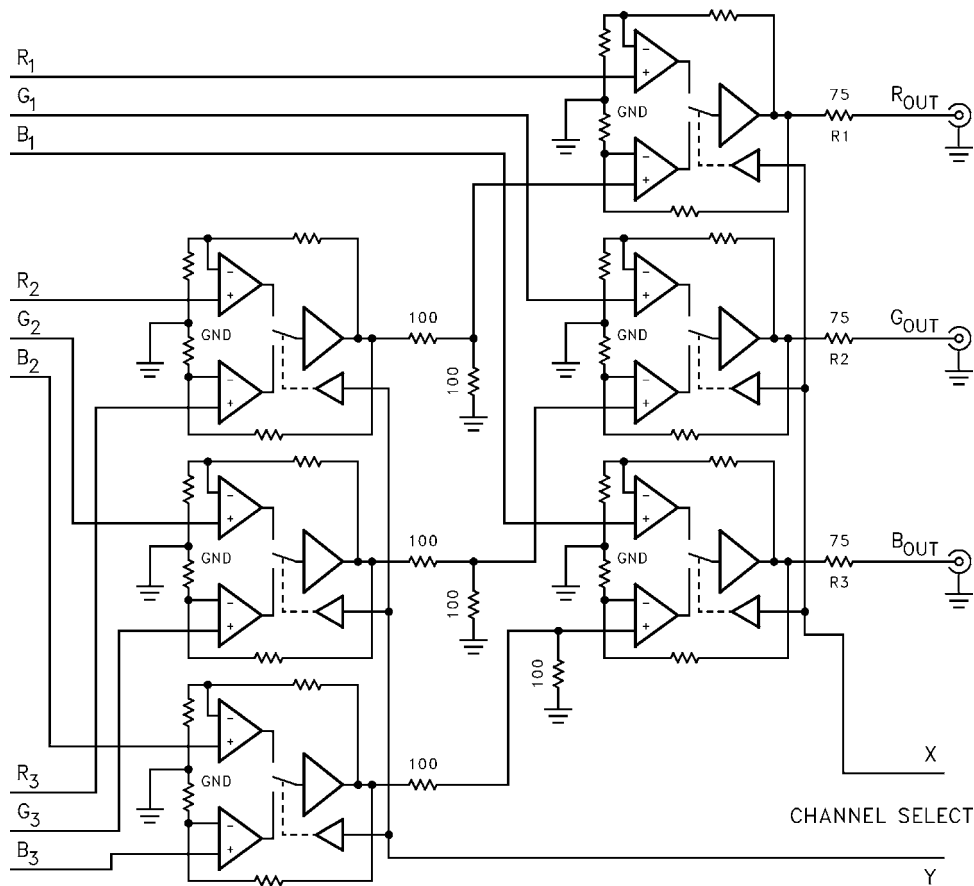

FIGURE 29. TYPICAL CONNECTION FOR A 3:1 COMPONENT VIDEO MULTIPLEXER

A Bandwidth Selectable Circuit

In Figure 30, a circuit is shown that allows three signals to be either low pass filtered or full bandwidth.

This could be useful where an input signal is frequently noisy. The component values shown give a Butterworth LPF response, with a -3dB frequency of 50MHz. Note again, the resistor values are low, so that stray capacitance does not affect the desired cut-off frequency.
