### Description

The HA-5135/883 is a precision operational amplifier manufactured using a combination of key technological advancements to provide outstanding input characteristics.

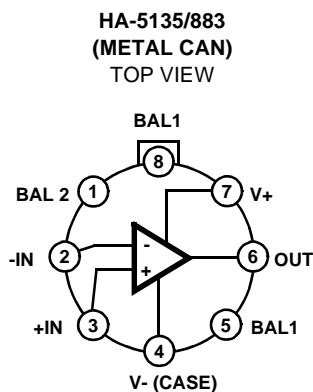

A high Beta input stage is combined with laser trimming, dielectric isolation, and matching techniques to produce  $75\mu\text{V}$  (max) input offset voltage and  $0.4\mu\text{V}/^\circ\text{C}$  (max) input offset voltage average drift. Other features enhanced by this process include  $9\text{nV}/\sqrt{\text{Hz}}$  (typ) Input Noise Voltage, 4nA Input Bias Current (max) and 120dB Open Loop Gain (min).

These features coupled with 106dB CMRR and 94dB PSRR make HA-5135/883 an ideal device for precision D.C. instrumentation amplifiers. Excellent input characteristics in conjunction with 0.6MHz (min) bandwidth and  $0.5\text{V}/\mu\text{s}$  (min) slew rate, makes this amplifier extremely useful for precision integrator and biomedical amplifier designs. These amplifiers are also well suited for precision data acquisition and for accurate threshold detector applications.

## NOTES:

- Offset adjustment range is [V<sub>IO</sub> (Measured  $\pm 1mV$ )] minimum referred to output. This test is for functionality only to assure adjustment through 0V.
- The input stage has series 500 $\Omega$  resistors along with back to back diodes. This provides large differential input voltage protection for a slight increase in noise voltage.

- Parameters listed in Table 3 are controlled via design or process parameters and are not directly tested at final production. These parameters are lab characterized upon initial design release, or upon design changes. These parameters are guaranteed by characterization based upon data from multiple production runs which reflect lot to lot and within lot variation.
- Full Power Bandwidth guarantee based on Slew Rate measurement using  $FPBW = \text{Slew Rate} / (2\pi V_{PEAK})$ .
- Power Consumption based upon Quiescent Supply Current test maximum. (No load on outputs.)
