

Ultra High Slew Rate Operational Amplifier

The HFA-0001 is an all bipolar op amp featuring high slew rate (1000V/μs), and high unity gain bandwidth (350MHz). These features combined with fast settling time (25ns) make this product very useful in high speed data acquisition systems as well as RF, video, and pulse amplifier designs. Other outstanding characteristics include low bias currents (15μA), low offset current (18μA), and low offset voltage (6mV).

The HFA-0001 offers high performance at low cost. It can replace hybrids and RF transistor amplifiers, simplifying designs while providing increased reliability due to monolithic construction. To enhance the ease of design, the HFA-0001 has a 50Ω ±20% resistor connected from the output of the op amp to a separate pin. This can be used when driving 50Ω strip line, microstrip, or coax cable.

Part Number Information

PART NUMBER	TEMPERATURE RANGE	PACKAGE
HFA1-0001-5	0°C to +75°C	14 Lead Ceramic Sidebrazed DIP
HFA1-0001-9	-40°C to +85°C	14 Lead Ceramic Sidebrazed DIP
HFA3-0001-5	0°C to +75°C	8 Lead Plastic DIP
HFA3-0001-9	-40°C to +85°C	8 Lead Plastic DIP
HFA9P0001-5	0°C to +75°C	16 Lead Widebody SOIC

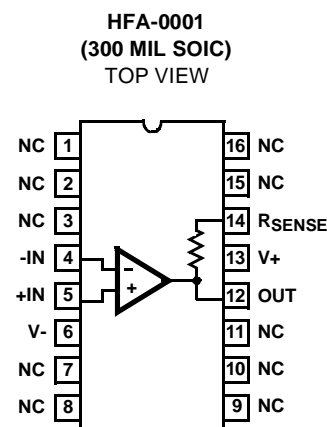

Features

- Unity Gain Bandwidth. 350MHz
- Full Power Bandwidth 53MHz
- High Slew Rate 1000V/μs
- High Output Drive. ±50mA
- Monolithic Construction

Applications

- RF/IF Processors
- Video Amplifiers
- High Speed Cable Drivers
- Pulse Amplifiers
- High Speed Communications
- Fast Data Acquisition Systems

Pinouts

Absolute Maximum Ratings (Note 1)

Supply Voltage (Between V+ and V- Terminals) 12V
 Differential Input Voltage 5V
 Input Voltage $\pm 4V$
 Output Current 60mA
 Junction Temperature (Note 9) $+175^{\circ}\text{C}$
 Junction Temperature (Plastic Package) $+150^{\circ}\text{C}$
 Lead Temperature (Soldering 10 Sec.) $+300^{\circ}\text{C}$

Operating Conditions

Operating Temperature Range
 HFA-0001-9 $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$
 HFA-0001-5 $0^{\circ}\text{C} \leq T_A \leq +75^{\circ}\text{C}$
 Storage Temperature Range $-65^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Electrical Specifications V+ = +5V, V- = -5V, Unless Otherwise Specified

NOTES:

1. Absolute Maximum Ratings are limiting values applied individually beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. $V_{OUT} = 0$ to $\pm 2V$, $R_L = 1k\Omega$.
3. $\Delta V_{CM} = \pm 2V$.
4. $R_L = 100\Omega$.
5. Full Power Bandwidth is calculated by equation: $FPBW = \frac{SlewRate}{2\pi V_{PEAK}}$, $V_{PEAK} = 3.0V$.
6. $V_{OUT} = \pm 200mV$, $A_V = +1$.
7. $V_{OUT} = \pm 3V$, $A_V = +1$.
8. $\Delta V_S = \pm 4V$ to $\pm 6V$.
9. See Thermal Constants in 'Applications Information' text. Maximum power dissipation, including output load, must be designed to maintain the junction temperature below +175°C for hermetic packages, and below +150°C for plastic packages.

Applications Information

Offset Adjustment

When applications require the offset voltage to be as low as possible, the figure below shows two possible schemes for adjusting offset voltage.

For a voltage follower application, use the circuit in Figure 29 without R_2 and with R_1 shorted. R_1 should be $1M\Omega$ to $10M\Omega$. The adjustment resistors will cause only a very small gain error.

FIGURE 29. NON-INVERTING GAIN

PC Board Layout Guidelines

When designing with the HFA-0001, good high frequency (RF) techniques should be used when making a PC board. A massive ground plane should be used to maintain a low impedance ground. Proper shielding and use of short interconnection leads are also very important.

To achieve maximum high frequency performance, the use of low impedance transmission lines with impedance matching is recommended: 50Ω lines are common in communications and 75Ω lines in video systems. Impedance matching is important to minimize reflected energy therefore minimizing transmitted signal distortion. This is accomplished by using a series matching resistor (50Ω or 75Ω), matched transmission line (50Ω or 75Ω), and a matched terminating resistor, as shown in Figure 30. Note that there will be a 6dB loss from input to output. The HFA-0001 has an integral $50\Omega \pm 20\%$ resistor connected to the op amps output with the other end of the resistor pinned out.

This 50Ω resistor can be used as the series resistor instead of an external resistor.

FIGURE 30.

PC board traces can be made to look like a 50Ω or 75Ω transmission line, called microstrip. Microstrip is a PC board trace with a ground plane directly beneath, on the opposite side of the board, as shown in Figure 31.

FIGURE 31.

When manufacturing pc boards, the trace width can be calculated based on a number of variables. The following equation is reasonably accurate for calculating the proper trace width for a 50Ω transmission line.

$$Z_O = \frac{87}{\sqrt{E_R + 1.41}} \ln \left(\frac{5.98h}{0.8w + t} \right) \Omega$$

Power supply decoupling is essential for high frequency op amps. A $0.01\mu F$ high quality ceramic capacitor at each supply pin in parallel with a $1\mu F$ tantalum capacitor will provide excellent decoupling as shown in Figure 32.

FIGURE 32. POWER SUPPLY DECOUPLING

FIGURE 33. IMPROVED DECOUPLING/CURRENT LIMITING

Chip capacitors produce the best results due to ease of placement next to the op amp and they have negligible lead inductance. If leaded capacitors are used, the leads should be kept as short as possible to minimize lead inductance. Figures 32 and 33 illustrate two different decoupling schemes. Figure 33 improves the PSRR because the resistor and capacitors create low pass filters. Note that the supply current will create a voltage drop across the resistor.

Saturation Recovery

When an op amp is over driven output devices can saturate and sometimes take a long time to recover. By clamping the input to safe levels, output saturation can be avoided. If output saturation cannot be avoided, the recovery time from 25% over-drive is 20ns and 30ns from 50% over-drive.

Thermal Management

The HFA-0001 can sink and source a large amount of current making it very useful in many applications. Care must be taken not to exceed the power handling capability of the part to insure proper performance and maintain high reliability. The following graph shows the maximum power handling capability of the HFA-0001 without exceeding the maximum allowable junction temperature of +175°C. The curves also show the improved power handling capability when heatsinks are used based on AVVID heatsink #5801B for the 8 lead Plastic DIP and IERC heatsink #PEP50AB for the 14 lead Sidebrazed DIP. These curves are based on natural convection. Forced air will greatly improve the power dissipation capabilities of a heatsink.
